

This is the first book to present a clear empirical picture of the international exchange of goods and of the resources that account for the differences that occur. Using tables, graphs, and econometric data summaries, it describes the patterns of trade and the patterns of resource supplies of fifty-nine countries and explains these trade patterns in terms of the abundance of eleven resources.

The author's scientific goal is to leave the reader with a clear impression of the empirical validity of a central result of trade theory—the Heckscher-Ohlin theory of international comparative advantage, in which a country's factor endowments (land, labor, capital) play a crucial role in determining trade patterns. The theory is fully articulated and carefully linked to the empirical analysis. The econometric methods and the results should create a standard by which other data analyses will be judged in the future.

Chapters cover theories of international trade, testing the theories of international comparative advantage, formation of the trade aggregates, data preview, econometric methods, estimates of the trade dependence model, and counterfactuals. Appendices present the effects of factor market distortions, statistics, and detailed discussions of the statistical results.

Edward E. Leamer is Professor of Economics at the University of California at Los Angeles.

Lectures on International Trade
by *Agostino N. Bagnasco and T. N. Srinivasan*

This text for graduate and upper-level undergraduate courses covers general equilibrium analysis of international trade, focusing mainly on the Ricardian and Heckscher-Ohlin theorems. It discusses the comparative statics of trade-theoretic analysis, focusing on tariffs and transfers. It examines the welfare possibilities of trade theory and deals with questions relating to optimal trade and nontrade policies under alternative assumptions relating to foreign trade opportunities and imperfections in the domestic markets. Analytical issues that have recently been raised in the literature on trade, growth, and development are taken up. Primary emphasis is placed on in-bijective arguments and simple geometric explanations and illustrations.

Essays in International Economic Theory

by *Agostino N. Bagnasco*
edited by *Robert C. Feenstra*
Volume 1: *The Theory of Commercial Policy*
Volume 2: *International Factor Mobility*

"Creative and rigorous analysis applied to vital policy problems—just what the market of a major economist like Agostino Bagnasco. His *Essays in International Economic Theory* deserves a place on all our bookshelves."

— Paul Samuelson

Trade Liberalization among Major World Trading Areas
by *John Whalley*

This book provides a much-needed quantitative response to the classic question of who gains and who loses in trade liberalization. It shows how important the liberalization process is for the global economy and it contributes significantly to the debate concerning trade between developed and developing countries.
