The book is an attempt to present a multi-factor multi-commodity theory of returns. The Heckscher-Ohlin Theorem is a multi-factor multi-commodity theory that explains how the returns to the multi-dimensional factors of production are distributed among the factors of production. The theorem is based on the idea that the returns to the factors of production are determined by the relative scarcity of the factors. The theorem is a powerful tool for understanding the distribution of returns among the factors of production.

The scientific goal of this book is to present a multi-factor multi-commodity theory that is capable of explaining the distribution of returns among the factors of production. Chapter 6 reports a statistical analysis of the relation between the 10 calculated cases and the expected outcomes. The results indicate a strong correlation between the two variables. Further research is needed to explore the underlying mechanisms and develop more refined models for predicting outcomes.

Chapter 7 discusses the implications of these findings for policy makers and practitioners. The authors recommend further research to validate the findings and to develop effective intervention strategies to address the identified issues. The book concludes with a call for interdisciplinary collaboration to advance the field of knowledge and practice in this area.
