How Merchant Towns Shaped Parliaments:
From the Norman Conquest of England to the Great Reform Act

This version: 2 June 2019

Abstract
After centuries of stagnation in the “Dark Ages,” the Commercial Revolution in the 11th century led to a boom in economic activity and urbanization across Western Europe. We study how Medieval self-governance emerged during this period, and how it interacted with institutional development. We focus on England after the Norman Conquest of 1066 and build a novel comprehensive dataset of 554 Medieval towns (boroughs). We show that towns on trade routes were particularly likely to obtain Medieval Farm Grants – the right of self-governed tax collection and law enforcement. We present evidence that Farm Grants, in turn, were stepping stones for representation in the English Parliament. We also show that Medieval self-governance interacted with nationwide institutional changes and strengthened the role of Parliament in the subsequent centuries: Self-governed towns resisted royal attempts to introduce patronage, maintaining broader voting rights. They also raised troops to back Parliament against the king during the Civil War in 1642, and they supported the modernization of Parliament during the Great Reform Act of 1832. We conclude that self-governed towns helped England to embark on a different institutional path relative to most of Continental Europe.

1 Introduction

Political institutions and the protection of property rights are important drivers of economic growth and development (c.f. North and Thomas, 1973a; Acemoglu and Robinson, 2012). In Medieval times, institutions throughout Western Europe were shaped by “coalitions of power holders” – important actors holding military, administrative, and religious power (North, Wallis, and Weingast, 2009). Initially, these included the king, the nobility, and the high clergy. By the early modern period, merchant towns had ascended to the coalition of power holders, and they were included in a key institution that exerted constraints on monarchs – parliament. Merchants’ inclusion in parliaments played a crucial role during critical junctures in subsequent centuries, determining economic outcomes. For example, Acemoglu, Johnson, and Robinson (2005) find that where “initial” institutions before 1500 placed checks on monarchs and protected property rights, the gains from Atlantic trade post-1500 were particularly large.1 These “initial” institutions have typically been taken as given by the literature.2

In this paper, we study the process by which medieval merchant towns became an essential part of the coalition of power holders, gaining representation in parliaments and shaping the evolution of this institution over the subsequent centuries. This process was triggered by the Commercial Revolution – a surge in economic activity in Western Europe beginning in the 11th century (Lopez, 1976). The rise of trade went hand-in-hand with the emergence of municipal autonomy of cities across Europe. Soon thereafter, kings summoned towns’ representatives in general assemblies, which evolved into parliaments. We study the relationship between trade, municipal autonomy, and parliamentary representation in the prominent context of England – “the mother of parliaments.”3 Our analysis begins with the Norman Conquest of England in 1066 – long before the creation of England’s first parliament. The Norman Conquest – “the single greatest political change England has ever seen”4 – represents a key turning point in English history. The Normans asserted strong control over the territory, implemented a feudal society, and replaced the Anglo-Saxon ruling elite with their own. This resulted in largely homogeneous formal institutions at the onset of the Commercial Revolution, so that England provides an ideal starting point for our analysis.

After the Norman Conquest, the kings ruling England relied on tax farming to collect ordinary revenues from their boroughs: Each borough was worth an annual fixed amount (the “farm”)

---

1Similarly, Pascali (2017) shows that the introduction of the steamship in the 19th century had a positive effect on economic development only in countries with strong constraints on executive power.

2Contributions in political economy that explain the enfranchisement of non-elite groups tend to focus on the 18th and 19th century (Acemoglu and Robinson, 2000; Lizzeri and Persico, 2004). Some historical studies have documented a close relationship between trade and institutions in the Medieval Mediterranean (Greif, 1993; Puga and Trefler, 2014). While the institutions studied in these papers supported Medieval trade, they eventually lost importance.

4The Economist, December 24th, 2016, p. 33.
that was based on the taxation of property, courts, and trade. For each shire (county), the king appointed a sheriff (“shire reeve”) – private individuals who “farmed” the collection of taxes and provided law enforcement. With the Commercial Revolution, the increasing need for a specialized administration made communities of merchants eager to exclude sheriffs from meddling with their local affairs. Beginning in the 12th century, merchant towns and the king found a mutually beneficial agreement: The king issued *Farm Grants* to some boroughs, allowing the community of burgesses to farm their own taxes. Boroughs with Farm Grants had the authority to appoint their tax collectors, judges, and market officials, which enabled more effective local law enforcement for commercial purposes. In exchange for Farm Grants, boroughs typically agreed to pay a higher annual lump sum of ordinary taxes to the king. The municipal autonomy resulting from Farm Grants separated the towns’ jurisdiction from that of the royal officials, thereby strengthening towns’ administrative power and elevating them into the coalition of power holders. By the end of the 13th century, these self-governing towns were summoned to Parliament, where they discussed and expressed their consent to extra-ordinary nationwide taxation (e.g., for wars). Self-governance implied a broader participation of townsmen in the administration of their borough and the election of their Members of Parliament (MPs), resulting in relatively open local institutions. Moreover, we argue that the community in Farm Grant boroughs had a natural interest in a functioning Parliament, which protected their autonomy and enabled them to lawfully deny funding to the king when appropriate. Correspondingly, we find that boroughs with Medieval municipal autonomy were capable of resisting royal interferences and strengthened Parliament during critical junctures in the centuries that followed – such as the Civil War in the 1640s and the Great Reform Act of 1832. The diagram below summarizes the steps of our argument.

![Diagram: Steps of the Argument](image)

Our argument is based on both the historical record and on detailed newly assembled data regarding political liberties of Medieval English boroughs (towns with a market and a trading community). We build a novel dataset for all 554 boroughs that existed before 1348 (using the time of the Black Death as a natural breakpoint). For each borough, we code its institutional history

---

5Farm Grants were only introduced after the Norman Conquest; they did not exist during Anglo-Saxon times, as documented by Maitland (1921, p. 204), Tait (1936, p. 71), Barlow (1961, p. 25), and Reynolds (1977, pp. 95-6). Also, towns were not directly represented in Anglo-Saxon assemblies (*witans*) – see Appendix C.9 for a detailed discussion. Besides Farm Grants, there were also other Charters of Liberties granted after the Norman Conquest; for instance, the right to hold a market, to prevent the entry of royal officials, or freedom from tolls throughout the realm. We predominantly use Farm Grants, but also explore other charters in our empirical analysis.
between 1066 and 1832, including Charters of Liberties, Charters of Incorporation, parliamentary franchise, troops raised to support Parliamentarians during the Civil War in 1642, and voting for the Great Reform Act of 1832. We also code borough-level characteristics such as taxable wealth assessed by the Normans in 1086, historical commercial importance, and geographic features. Our analysis is organized into three parts.

We begin by analyzing the determinants of Farm Grants in the Medieval period. By 1348, 90 out of the 554 boroughs had obtained Farm Grants. We show that Farm Grants were particularly likely to be granted to royal boroughs with geographic characteristics conducive to trade (proximity to navigable rivers, the sea coast, or Roman roads). We also use other proxies to show that Farm Grant boroughs were commercially more important in Medieval times. This supports our argument that Farm Grants were particularly valuable to commercial towns, where the need for an efficient administration and contract enforcement was greatest.

The second step of our argument connects Farm Grants to representation in Parliament. The ‘Model’ Parliament in England assembled in 1295 and met on a regular basis thereafter. A central purpose of Parliament was to discuss (and receive consent for) extra-ordinary taxes, which were collected nationwide, typically to finance wars. The king had a particularly pronounced need to seek consent from boroughs that had obtained the right to self-administer their tax collection. There, he depended on the cooperation of the autonomous local administration to assess movable wealth and collect taxes. In other words, Farm Grants increased the administrative power of boroughs and thus the likelihood of being enfranchised (see González de Lara, Greif, and Jha, 2008, for a similar reasoning).

We find strong empirical support for a close relationship between Farm Grants and representation in Parliament. Out of the 90 boroughs with Farm Grants, 64 (71.1%) were enfranchised by 1348; as compared to 66 out of all other 464 boroughs (14.2%). This stark difference proves highly robust in our regression analysis.

In the third part of our analysis, we document how Farm Grants shaped local and national institutions over centuries after they were granted. At the local level, we show that Farm Grant boroughs resisted royal meddling and patronage: They were more independent from the king in appointing their local governing body, and they had a persistently wider franchise in electing their representatives. Parliament was an efficient and expedient way to hold negotiations with many stakeholders. See for example Bates and Lien (1985, p. 56) who observe that “bargaining for taxes was costly to monarchs. Monarchs therefore appear to have desired to bargain with fewer agents – ones representative of the set of all agents.” Negotiating taxes in Parliament also helped to legitimize them and thus avoided protests (Strayer, 1947).

This reasoning is also related to theories that link taxation of movable wealth (which could be avoided more easily than taxes on land) to institutional change. For example, Bates and Lien (1985, p. 53) argue that “Revenue-seeking governments may well find it to their advantage to strike bargains with citizens whose assets they seek to tax. [...] Such bargains may become more beneficial...the more mobile the assets the citizens hold.”

The timing also supports our interpretation of Farm Grants as ‘stepping stones’ for representation in Parliament: Among the 64 Farm Grant boroughs that were enfranchised by 1348, 58 were summoned to Parliament after they had received Farm Grants, and only six were first enfranchised and then received a Farm Grant. Among the latter six boroughs, three had other forms of municipal autonomy that we discuss below.
MPs. At the *nationwide* level, we show that Farm Grant boroughs took steps inside and outside of Parliament to protect and strengthen this institution. They were significantly more likely to provide volunteer troops to fight on the side of the parliamentarians at the outbreak of the Civil War in 1642, which prevented a weakening of municipal liberties and resulted in greater parliamentary control over the crown. This led England to embark on a different institutional path compared to most of Continental Europe, where tax farming and patronage became prominent again, and where parliaments were increasingly bypassed (as discussed in Section 7). In addition, we show that Medieval Farm Grants are a strong predictor of a borough’s MPs voting in favor of the Great Reform Act of 1832 – a crucial step in the democratization of England that reduced patronage and made Parliament more representative of the newly industrialized localities (Lizzeri and Persico, 2004; Aidt and Franck, 2015).

An important limitation of our analysis is that Farm Grants were not randomly assigned. Ultimately, our results reflect correlations that could also be driven by omitted variables. For example, politically well-connected boroughs may have obtained both Farm Grants and seats in Parliament. We address these concerns in several ways. First, we discuss primary historical and secondary sources that support a link between commerce and Farm Grants, and subsequently between boroughs’ administrative autonomy and enfranchisement. Second, we provide empirical support for this relationship, using trade-favoring geography of Medieval boroughs (navigable rivers, sea coast, and ancient Roman roads). We find strong results, both in the ‘first stage’ – trade geography predicting Farm Grants – and in the ‘second stage’ – boroughs with trade-related Farm Grants being summoned to Parliament. While this two-step analysis lends support to our proposed mechanism, it must be interpreted with caution: Trade itself may have driven later institutional outcomes, independent of Farm Grants (e.g., via wealth). We check this ‘exclusion restriction’ by exploiting a historical feature: Boroughs belonged either directly to the king (“royal boroughs”), or to a local mesne (lay or ecclesiastical) lord. Farm Grants were almost exclusively granted to royal boroughs by the king. Mesne lords rarely issued Farm Grants because they controlled smaller territories than the king and thus had less need to delegate administrative tasks. Consequently, we can use mesne boroughs as a ‘placebo’ to test if trade geography predicts representation in Parliament independent of Farm Grants. For mesne boroughs, we find no such relationship – despite the fact that Parliament was composed in nearly equal proportions of royal and mesne boroughs. In other words, in the absence of Farm Grants, merchant boroughs were not more likely to be enfranchised.\(^9\) We use these findings to motivate a setup akin to difference-in-differences, where

\(^9\)We argue that Farm Grant boroughs were more likely to be enfranchised because the king needed their cooperation to collect extra-ordinary taxes. For our use of mesne boroughs as a ‘placebo,’ it is important to note two institutional similarities for royal and mesne boroughs: First, mesne boroughs also had to pay extra-ordinary taxes to the king – at the *same* rate as royal boroughs – despite the fact that they belonged to a local lord (Willard, 1934). The reason is that extra-ordinary taxes were typically used to finance wars; they thus concerned the whole realm and were collected from *all* boroughs by royal officials. Second, the process by which the king summoned administratively important
trade geography *interacted* with royal borough status is used to predict Farm Grants in the ‘first stage,’ while controlling for these variables in levels in both stages. The corresponding two-stage least square (2SLS) results for institutional outcomes are very similar in both magnitude and significance to our main results.\(^{10}\)

Finally, we perform an additional placebo check for our long-run outcomes. We use historical records to identify boroughs where exogenous events (such as silting up of rivers) permanently obstructed trade after they received Farm Grants. We show that, even in the absence of trade, Farm Grants predict long-run institutional outcomes. This makes it unlikely that our results are confounded by a direct effect of trade on institutions (or by unobserved correlates of trade). Overall, our results thus suggest that Farm Grants acted as stepping stones for merchant towns’ representation in Parliament and for their contribution to England’s nationwide institutional development. After documenting this mechanism for England, we discuss differences and similarities in the historical development of institutions in other regions of Western Europe.

Our paper makes novel contributions along three main dimensions: First, we study the economic determinants of Medieval self-governance in a large cross-section of towns, drawing attention to the so-far understudied role of Medieval Farm Grants. Second, we establish the link between Farm Grants and towns’ representation in Parliament. Third, we document long-run interactions between local self-governance and nation-wide institutions. We discuss the related literature in Section 2. In Section 3 we present the historical background, and in Section 4, our data. Section 5 presents our main empirical results on Farm Grants and representation in Parliament by 1348, and Section 6, our results on local and nationwide institutions in the centuries thereafter. Section 7 offers a comparative analysis of five regions in Western Europe, discussing similarities and differences in the interplay of municipal autonomy and institutional development. Section 8 concludes.

2 Related Literature

The relationship between inefficient local bureaucracies and the emergence of local political liberties has been investigated in the modern context (Bardhan, 2002; Bardhan and Mookherjee, 2006). Our paper contributes to this literature by systematically analyzing the relationship between trade,
taxation, and self-governance over the long run, and linking it to the emergence of broader voting rights. Greif, Milgrom, and Weingast (1994), Stasavage (2014), and Puga and Trefler (2014) investigate the link between the interests of the merchant class and institutional developments.\footnote{Greif et al. (1994) emphasize the role played by Medieval merchant guilds as a commitment device for autocratic rulers. By coordinating the responses of merchants to expropriations by rulers, Medieval guilds allowed for an increase in trade volumes, from which both rulers and merchants benefitted. Stasavage (2014) analyzes ca. 170 Western European towns between AD 1000 and 1800 and shows that the control of local institutions by merchant (and craft) guilds initially fostered population growth, but later hampered it. Since this study covers cities across Europe, it relates to our discussion of city autonomy in areas governed by small local vs. large territorial lords in Section 7. Puga and Trefler (2014) show that in late Medieval Venice, trade led first to constitutional constraints on autocratic rulers and then to the rise of a narrow oligarchy. While Puga and Trefler (2014) examine merchant families within Venice, we focus on a large cross-section of towns and analyze how local institutions interacted with national ones (e.g., Parliament).}

The interaction between local and national institutions links our paper to Barzel (1997), González de Lara et al. (2008) and Van Zanden, Buringh, and Bosker (2012), who argue that the balance of administrative power between king, feudal lords, and towns was an important determinant of the early European national representative system. In line with our findings, González de Lara et al. (2008) argue that the rising administrative power of towns in Medieval times constrained English monarchs – long before the Civil War and the Glorious Revolution in the 17th century, which have received most attention by scholars. In a similar context, Acemoglu and Robinson (2017) model the competition for dominance between the state and civil society. Relating our empirical findings to their theory, early modern England represents a “happy middle ground” where state and civil society were in relative balance. This triggered positive competition that resulted in the emergence of an inclusive state.\footnote{A concrete example for this “positive competition” is English cities obtaining liberties in exchange for paying higher taxes that supported the state. Liberties, in turn, improved cities’ bargaining power.} Glaeser and Shleifer (2002) make the case that the English kings’ ability to control the territory vis-à-vis feudal lords is important to understand the spread of the Common Law legal system, in which the king delegates adjudications to better-informed local juries.\footnote{There are parallels to our analysis: Similar to Glaeser and Shleifer (2002), we argue that decentralization (by issuing Farm Grants) was an efficiency-enhancing outcome because it allowed better-informed local stakeholders to collect taxes and enforce justice. Crucially, in boroughs that obtained independent justice, the king kept the right to intervene in case of judicial conflict via itinerant royal justices who regularly checked on local officials. In line with Glaeser and Shleifer (2002), this system could only work because the English kings were sufficiently powerful to have local influence.} We contribute to this strand of the literature by investigating the sources of towns’ fiscal and judicial autonomy, and the far-reaching effects of local liberties.

North and Thomas (1973a), North and Weingast (1989), Bates and Lien (1985), and Stasavage (2011) also emphasize the relationship between the rise of trade and the evolution of constitutional constraints on rulers. Jha (2015) shows that financial innovations – i.e., stock ownership in overseas companies – fostered MPs’ support for Parliament during the English Civil War, which in turn strengthened parliamentary control over sources of revenues. Our focus is on the earlier – and often overlooked – spread of political liberties to merchant towns and their initial representation.
in Parliament. In the spirit of Levi (1999), self-governance restricted the ruler’s ability to extract resources from towns, and led to their representation in Parliament, where extra-ordinary taxation was negotiated. Wars – and the need to finance them – are often considered vital to the evolution of political liberties (see, for instance Bates and Lien, 1985). We point to a novel channel through which wars can lead to liberties. Because conflicts were often fought abroad, the king’s absence from England and his significant need for revenues exacerbated the issue of controlling the royal administration, which in turn increased the king’s willingness to issue Farm Grants. Since these, in turn, led to representation in Parliament, warfare did not only affect state capacity (c.f. Tilly, 1990; Besley and Persson, Besley and Persson; Gennaioli and Voth, 2015), but also institutional change.

Finally our paper is related to the literature on the determinants of franchise extensions. One leading explanation is that democratization serves as a commitment device for redistribution under the threat of revolution (see Acemoglu and Robinson (2000) for a theoretical contribution and Aidt and Franck (2015) for empirical results that support this channel). In addition, oligarchies may voluntarily extend the franchise when this process leads to a more efficient provision of public goods (Lizzeri and Persico, 2004). Our results emphasize the “deep roots” of voting for the Great Reform Act of 1832. This may have been motivated both by their history of self-governance (and thus broader local franchise), but also because the Act increased the pro-trade coalition in Parliament. This finding – together with our result that towns with Medieval Farm Grants were more likely to support parliamentarians during the Civil War – contributes to the literature on the historical roots of political institutions (Persson and Tabellini, 2009; Giuliano and Nunn, 2013; Guiso, Sapienza, and Zingales, 2016).

3 Historical Background

This section summarizes the historical background of institutions in England after the Norman Conquest, with a focus on the emergence of Farm Grants and the representation of boroughs in Parliament. Appendix A complements this section with a case study of two trading towns, one royal and one mesne, that were ex-ante similar but took different institutional paths.

3.1 The Norman Conquest

In 1066, William the Conqueror (Duke of Normandy) landed at Pevensey, heading a large French-Norman army to conquer England. The conquest resulted in a dramatic change in land ownership, as documented in the Domesday Book of 1086. The Normans replaced the entire Anglo-Scandinavian elite: by 1086, 180 barons had appropriated the land of 80 English lay lords; only

---

14Appendix B.2 shows that the timing of Farm Grants in Medieval England is closely aligned with external wars. Complaints about royal officials were also particularly frequent when the king was away due to wars, so that his administration governed largely unchecked. See for example the “Enquiry into offences by royal officials during the king’s absence 1286-9” reported in Douglas and Rothwell (1996).
two Englishmen were still holding large estates from the king (Barlow, 1961, pp. 94-96). The ecclesiastical landholders (e.g., bishops) were also replaced. Compared to the Anglo-Saxon period, the Normans strengthened the control over the territory by greatly diminishing the power of the earls and imposing a homogeneous feudal society (Brooke, 1961). In addition, the local administration was also largely replaced, as we document below. In sum, the Norman Conquest resulted in relatively homogenous formal institutions across England and thus constitutes an ideal starting point for our analysis.

### 3.2 Territorial Administration: Royal and Mesne Territories

Post-Norman-Conquest England was divided into shires (modern-day counties), and these were in turn divided into hundreds. Each hundred was composed of manors within which rural and urban settlements – villages and boroughs – coexisted. Boroughs were characterized by the presence of a market and a trading community. While villagers provided labor services to their lord, burgesses held land at a money rent (land gable); burgesses could also sell, mortgage, and leave their land property in the borough in inheritance. Our focus is on boroughs because these were the main locations of merchant activities in Medieval and early modern England.

Figure 1 illustrates the administrative layers in Medieval England. The person with the highest authority over an area was its owner: either the king or a local (mesne) lord. In the centuries following the Norman Conquest, approximately 25% of all boroughs belonged to the king, 50% to lay mesne lords, and 25% to ecclesiastical mesne lords. Our dataset contains 145 royal and 409 mesne boroughs (explained in detail in Section 4.1). While mesne lords were tied to the king by feudal (military) obligations, they were entitled to receive the entirety of their land’s profits (except for extra-ordinary taxes, as explained below). As shown in Figure 1, the king and mesne lords appointed officials who enforced the law and collected taxes in their respective territories. The king appointed sheriffs in each shire. These, in turn, appointed bailiffs in hundreds and boroughs that belonged to the royal demesne (Tait, 1936). Officials had fiscal and judicial authority within their jurisdiction, and each responded to the officials with wider jurisdiction. Mesne lords organized the administration of their territories largely independently of royal officials. However, they governed significantly smaller territories than the king. Consequently, mesne lords were more familiar with local affairs, and they directly appointed and monitored local officials in their boroughs.

---

15Land tenure in boroughs was known as burgage tenure, which was similar to freeholding (Ballard, 1913; Tait, 1936). Burgesses could move as part of their trading activity. However, acquiring the status of burgess in a borough other than that determined by birth was difficult.

16Throughout the text, we refer to both lay and ecclesiastical lords as mesne lords. “Mesne” means “middle” in Medieval French, referring to the position of mesne lords, who had vassals, but were themselves vassals of the king.

17See Ballard (1913) and Green (1989). In particular, the sheriff presided over the shire court, and borough bailiffs ran royal borough courts that dealt with trespassing, debts, and disputes between merchants (Cam, 1963). Other officials existed at both the shire/hundred level (e.g., shire justiciars and itinerant justices) and the borough level (e.g., coroners, ale-tasters, and toll collectors). See Cam (1963) for detail. These officials were also appointed by higher layers of the royal administration – except for the local officials in boroughs with self-governance, as we discuss below.
3.3 The Commercial Revolution: Boroughs, Markets, and Trade

Our analysis coincides with the Commercial Revolution – a period of booming economic activity that saw substantial increases in urban settlements and trade across Western Europe. The Commercial Revolution was driven by events exogenous to England, such as regained access to Mediterranean trade (Pirenne, 1925), significant technological progress (Langdon and Masschaele, 2006), and population growth (North and Thomas, 1973b). In England, the number of recorded urban settlements increased drastically: Boroughs went from 112 in 1086 to 554 by 1348. Around 150 fairs were established by the end of the twelfth century, and more than 1,000 newly licensed markets were recorded between 1200 and 1349 (Britnell, 1981; Masschaele, 1997; Langdon and Masschaele, 2006). Tolls and fees from trade became a substantial part of the royal budget. Richard I introduced the first national customs tariff. In 1203-4, a total of £4,958 were collected from 35 ports, a sum equal to the total value of all mesne lords’ lands in 1086, as recorded in the Domesday Book (Langdon and Masschaele, 2006).

3.4 Taxation and Tax Farming

In the Middle Ages, there existed a distinction between ‘ordinary’ and ‘extra-ordinary’ taxation: The former accrued to the lord of the borough and the latter, to the king. In what follows, we describe both.

Ordinary Taxation. The contractual arrangement between the king and his tax-collecting officials was known as tax farming. The farm of a territory was a fixed amount of money representing the sum of all tax revenues from that territory. For urban settlements, this reflected taxes on trade such as tolls and market transaction fees, as well as court fees and the gable (a tax on the “burgage tenement” – the land owned by burgesses). Farms were customarily fixed for each borough (and also for rural villages and manors) right after the Norman Conquest, based on the Domesday survey of 1086. Adding these customary farms over all royal boroughs and manors within a shire (county) gave the customary shire farm. With the booming economic activity in the late Medieval period, the king adopted a system that allowed him to benefit from the increased tax base without the need to adjust the customary farm. He began to auction off the right to collect the farm at the shire level, and the customary shire farm reflected the king’s “reservation price.” Whenever the winning bid exceeded this value, the king enjoyed an increment. The official who won the auction

---

18See Ballard (1904) and Masschaele (1997). Other permanent sources included the proceeds from the lord’s demesne houses (gablum) and receipts from mints (Ballard, 1904, pp. 63-64).

19The Domesday Book was an exhaustive survey of all English lands (landholders, tenants, inhabitants, etc) conducted in 1086. The main purpose of the survey was to assess the value of the land and its assets. To conduct it, England was divided into seven regions, with three to four royal commissioners sent to each. These royal commissioners surveyed thousands of settlements, by subjecting juries composed of nobles and burgesses to detailed questioning. As Jenkins (2011, pp. 38-39) observes, “The survey was...dubbed the Domesday Book by the Saxons, because its decisions, like those of the Day of Judgment, were unalterable. [...] It did more than record. It marshalled Norman England into an administrative whole.”
became the sheriff ("shire reeve"), who was responsible for the farm of the shire (Ballard, 1913). The sheriff retained any revenue in excess of his bid to the king. Sheriffs were often drawn from the royal court (curia regis); they had limited knowledge of local economic conditions and were not commercial specialists (Poole, 1955; Harris, 1964; Carpenter, 1976; Green, 1989). This lack of specialization became particularly relevant after the onset of the Commercial Revolution, when there was increasing demand for an efficient handling of markets and commercial contracts. Due to the frequent bidding for the office (especially in the 13th century), sheriff positions also had a relatively high turnover, with typical term lengths of about 3-5 years (Heiser, 1997). The short tenure of sheriffs invited predatory behavior and contributed to their wide-spread misconduct, which we elaborate in Appendix B.1. In mesne boroughs, the local lords were entitled to ordinary taxes and thus appointed the officials in charge of ordinary tax collection.

*Extra-Ordinary Taxation.* The medieval legal doctrine allowed kings to request an extra-ordinary ‘aid’ from all subjects in specific situations that affected the whole realm (e.g., wars), known as ‘cases of necessity’ (Harriss, 1975). When these cases arose, all boroughs – independent of their ownership – had to contribute at the same tax rate (c.f. Willard, 1934, p. 10). That is, mesne boroughs were just as concerned with extra-ordinary taxation as royal boroughs. For instance, “in 1296 all towns alike paid an eight [of their movable goods]” (Pasquet, 1964, p. 152). The sheriff administered the collection of extra-ordinary taxes in both royal and mesne boroughs alongside royal tax assessors of movable wealth. In royal boroughs, he relied on his appointed officials to collect extra-ordinary taxes (except in Farm Grant boroughs, who elected their own officials); in mesne boroughs, royal assessors and the sheriff collected extra-ordinary taxes in cooperation with the lord, his officials, and representatives of the local communities (Mitchell, 1951). As we explain below, there is also an important connection between extra-ordinary taxation and Parliament: Boroughs acknowledged the existence of a ‘case of necessity’ by giving their consent to extra-ordinary taxation in Parliament.

### 3.5 Farm Grants in Royal Territories

The boom in commercial activity in the 12th-13th century exacerbated the distortions imposed by an inefficient administration, preventing merchant boroughs from reaching their full economic potential.\(^{20}\) This meant that there was scope for efficiency gains, and the key laid in self-administered tax collection – despite the fact that this meant a considerable loss of administrative control for the king.

\(^{20}\) Accordingly, several statutes sought to address the need for registered commercial contracts and more potent dispute resolution (e.g., the Statute of Acton Burnell in 1283, the Statute of Merchants in 1285, and the Statute of Westminster II in 1285). The Statute of Merchants states that i) speedy justice is needed to support trade, ii) the sheriffs meant to provide it abused their position, and iii) justice to merchants is therefore the responsibility of mayors elected by burgesses (where relevant). For further detail see Ballard and Tait (1923); Tait (1936); Poole (1955); Powicke (1962); Cam (1963).
Starting with Henry I, many boroughs obtained the right to self-administer the collection of the borough farm (“Farm Grants”). Lincoln was the first borough to receive a Farm Grant in 1130. The initiative in seeking administrative autonomy was often taken by merchant guilds or similar local collective action bodies (Reynolds, 1977). Boroughs paid the king in exchange for these liberties. Payments included a one-time lump-sum known as fine, as well as two annual components: i) the farm (which had previously been collected by the sheriff), and ii) an increment on the farm. The fine – usually of a similar magnitude as the annual farm – was often used to quickly raise money during wars (Tait, 1936). This can explain the close association between Farm Grants and external wars (see Appendix B.2). The Charter of Andover (granted in 1205) illustrates the two annual components of Farm Grants:

“Know ye that we have granted [...] to our burgesses of Andover our manor of Andover with all its appurtenances at fee farm, to hold to them and their heirs of us and our heirs by the ancient farm, to wit, at £80 a year, and as increment £15 which they formerly gave us for having the said manor at farm during our pleasure, and in addition £10 which they afterwards added for having the said manor at fee farm, and this farm, to wit, £105 in the whole, they shall pay at our Exchequer yearly to us by their own hands [...]”

The Charter first notes that Andover was worth a farm of £80 a year (collected by royal officials). Andover then agreed to pay an increment of £15 per year for the right of self-administered tax collection, and an extra £10 per year for the right to keep this contract in perpetuity. Where detailed records survived, they suggest that this setup is representative, and that Farm Grants typically constituted a net gain in tax revenue to the king (c.f. Ballard, 1913, pp. lxxvi-lxxvii). This gain for the king arguably compensated for the (expected) loss of administrative control and future information about local economic conditions.

Did burgesses gain equally from Farm Grants? To provide quantitative evidence, we would need to know how much royal officials were extracting for themselves prior to a grant. This information was not recorded. However, Farm Grants were not imposed; they were an option for burgesses. This implies that burgesses must have benefitted, as well. Bristol’s petition to the King in 1283 illustrates that merchants were well-aware of the benefits of Farm Grants:

---

21Earlier, other Charters of Liberties were granted to some boroughs – most prominently the right to hold a market and have a borough court. It was a royal prerogative to grant charters bestowing market licenses across both royal and mesne territories. However, this was not the case for Farm Grants, which could only be granted by the owner of the respective territory (who also collected the borough’s farm). The king neither had the right nor an interest in unilaterally issuing Farm Grants to mesne boroughs, because he was not the recipient of their ordinary taxation.

22Farm Grants – even those issued in perpetuity – were subject to revocation: In case burgesses failed to pay the agreed-upon farm, the king would temporarily remove these liberties and send royal officials into town.

23In particular, a net gain for the king implies that a borough’s annual fee for its Farm Grant was larger than the decline in the total farm collected from the corresponding shire. For instance, in Lincoln, burgesses paid £180 to the king, while the sheriff’s farm of the entire shire was reduced by only £140, implying a gain of £40 to the king. One may presume that sheriffs would oppose Farm Grants because they were the losing party. Even though sheriffs tried to oppose early legislation that limited their judicial prerogatives (Holt, 1981), their position was much too weak – as shown by their wholesale dismissal in several occasions (Maddicott, 1981) – to stage successful opposition to Farm Grants, and no such incidences are documented.
“Since none can know so well as those whose work is concerned with merchandise, and who earn their living by it, how to regulate the affairs of merchants properly and honestly, the Commonalty of Bristol entreats the Lord King that, if he should wish to grant his town at farm to anyone, he should concede it to them, since they would be prepared to give as much for it as any outsider. For an outside farmer would not seek it except for his own personal gain, which would be to the serious loss of the Commonalty. And the Commonalty seeks it to farm, not for the sake of profit, but to safeguard, according to the law merchant, both themselves and others coming there.” (Cronne, 1946, pp. 42-3).

Farm Grants included the right for burgesses to elect the local officials in charge of the financial and judicial administration of the borough, such as reeves and market officials (Gross, 1906; Ballard, 1913; Tait, 1936). As suggested by Bristol’s petition, Farm Grants gave boroughs an opportunity to select a more commercially specialized administration, with better-aligned incentives. Typically, all male burgesses had a say in the election of a borough’s officials. For example, the Ipswich Dom-Boc of 1291 states that “…the whole town of the borough of Ipswich gathered in the churchyard of St. Mary at Tower to elect two bailiffs and four coroners for the town, according to the specifications of the charter of the aforesaid lord King [John], which that king recently granted to the borough.”

3.6 (The Absence of) Farm Grants in Mesne Territories
Farm Grants were almost exclusively granted to boroughs in royal territories – despite the fact that these merely accounted for one-fourth of all boroughs. As shown in Figure 2, 90 out of 554 boroughs that existed in 1348 received Farm Grants. Among the 145 royal boroughs, 74 received Farm Grants (51.0%). In stark contrast, among the 409 boroughs governed by mesne lords, only 16 obtained Farm Grants (3.9%). These differences were likely due to several reasons: First, mesne lords were in charge of much smaller territories than the king. Consequently, there was less scope for delegating administrative tasks and, more generally, for the “farming” of taxes by either private individuals or communities. Consistent with this view, the range of officials in mesne territories was more limited (see Figure 1). Second, mesne lords often had castles, fortifications, or other dwellings in the boroughs under their control and thus possessed detailed local knowledge about the needs of the community. This, for instance, occurred in Oxford and York – two boroughs with Farm Grants – whose Common Council was representative of the community of freemen (Hammer, 1978; Carpenter, 2000).

Figure A.2 in the appendix provides a map of Farm Grants, showing that there is no apparent clustering; Farm Grant boroughs are spread relatively evenly across England.

---

24Because borough officials also collected taxes on merchants coming from different boroughs, burgesses – once in control of the local administration – may have been tempted to extract high taxes from external merchants. However, the king forbade this practice and enforced limits to taxes on trade (Britnell, 1978; Masschaele, 1997).

25Original text (in Latin) from Gross (1890, pp.116-123). Translation adapted from “History of Medieval Ipswich” (http://users.trytel.com/~tristan/towns/ipswich2.html). In practice, councils composed of wealthy individuals were often in charge of choosing officials. Examples include Norwich, where by the end of the 13th century, officials were chosen by an annually elected body of 24 (usually wealthy) citizens. In Exeter, surviving records indicate that, in the 1260s, 36 electors (chosen by a group of four influential citizens) chose the chief officials of the city (Attreed, 2001, pp. 14-22). Nevertheless, even in this case, local interests (e.g., those of merchants and craftsmen) were represented to a larger extent than in boroughs without Farm Grants, where the sheriff alone appointed local officials. This, for instance, occurred in Oxford and York – two boroughs with Farm Grants – whose Common Council was representative of the community of freemen (Hammer, 1978; Carpenter, 2000).
that was also passed on to their heirs. This further reduced the scope for delegating tax collection and law enforcement to communities of burgesses. Finally, when they did delegate, mesne lords exerted a firmer control over their administration (Tait, 1936). Correspondingly, complaints against officials in mesne territories were less common than in the royal demesne (Jobson, 2012, p. 30).

**The Role of Territory Size.** We argue that owners of larger territories lacked knowledge of local economic conditions, which created the need to delegate administrative tasks (e.g., via instituting tax farming by either private individuals or communities of burgesses). If this can explain the issuance of Farm Grants, it should also apply to relatively large mesne territories. Figure 3 shows that this is indeed the case: Among the lords with the smallest territories (seigneurs, abbots, and nunneries), there are essentially no Farm Grants. Boroughs in territories administered by bishops (which were of intermediate size) received some Farm Grants. Finally, among the largest mesne lords (earls and archbishops), the proportion of boroughs with Farm Grants was significantly larger – albeit still only one-fifth of the frequency in the much bigger royal territories.

### 3.7 Additional Liberties

Boroughs that obtained Farm Grants often obtained additional Charters of Liberties that restricted the entry of the sheriff and his officials. These included i) the right to forbid the sheriff from entering the borough to perform judicial tasks (non-intromittat clause), ii) the right to circumvent the sheriff, by handing over the farm and all other debts owed to the king directly to the Exchequer (direct relation with the Exchequer), and iii) the right for burgesses to execute royal orders themselves within the borough – for example, to summon local juries for assessment and collection of extra-ordinary taxation (return of writs). These rights complemented Farm Grants by strengthening the independence of local officials and thus the extent of self-governance. When endowed with these additional liberties, Farm Grant boroughs became ‘fully’ separate jurisdictions. In Appendix C.8 we code additional frequently awarded liberties: the right to collect special taxes to repair walls (“Murage”) or pave streets (“Pavage”), and the right to elect local officials (other than those involved in the collection of the farm, e.g., mayors). These liberties provided a lower degree of self-governance than Farm Grants; we use them as proxies for burgesses’ capacity to organize.

---

27 An example is the borough of Arundel in south England. The borough was under the control of the Fitzalan mesne lord dynasty, who resided in Arundel Castle. Arundel did not receive a Farm Grant, despite the fact that it “as the trading centre of the honour, had by [the early 14th century] developed to quite substantial proportions” (http://www.historyofparliamentonline.org/volume/1386-1421/constituencies/arundel).

28 One may think that royal boroughs closer to London would have suffered less from monitoring issues. However, in that period, the royal court was itinerant rather than permanently based in London. Moreover, the king himself was constantly on the move due to conflicts (c.f. Hindle, 1976). Also, there were no administrative restrictions on Farm Grants in mesne territories: Mesne lords were independent from the king in granting charters to their boroughs.

29 For further detail see Ballard (1913) and Ballard and Tait (1923). Similar to Farm Grants, these additional liberties had to be petitioned by burgesses. They were paid for by an up-front fine, but did not require annual payments.
3.8 Early Parliaments and Extra-Ordinary Taxation

The origins of the English Parliament can be traced back to the great councils of the realm whose main purpose was to gather information about local economic and political conditions (Holt, 1981; Post, 1943) and to discuss extra-ordinary taxation to be levied in ‘cases of necessity.’ Since 1188, in the context of the Commercial Revolution, extra-ordinary taxes were increasingly levied on movable wealth. The king was sufficiently strong to impose the presence of royal assessors and collectors across the realm – including in mesne territories (Mitchell, 1914). As explained above, extra-ordinary taxes were collected on top of ordinary taxes when deemed necessary. Because they were not customary, in accordance with the medieval doctrine known as Quod omnes tangit, they required the consent of all contributors. In practice, consent was given in general assemblies to which, up until the first half of the 13th century, only barons and the higher clergy were summoned (Post, 1943; Mitchell, 1951; Harriss, 1975). The Magna Carta in 1215, and the events leading up to it, entrenched the importance of the great councils as a check on royal power. Soon after, it became customary to refer to these broader councils as parlement (from the Anglo-Norman verb parler – ‘to talk’).

Initially, these councils did not include merchants and burgesses. This changed in 1265, when Simon de Montfort headed the Second Baronial Revolt. Facing dwindling support among the barons, Montfort also summoned boroughs to a national assembly in an attempt to expand his coalition against the king. This set the precedent for the representation of burgesses in what became the Commons (lower chamber) in the English Parliament (while lords and bishops are represented in the Upper House – the ‘House of Lords’). From 1268 onwards, shortly after having re-established his authority, the king summoned similar assemblies that included borough representatives, and, in 1295, Edward I called what would become known as the ‘Model Parliament.’ The composition of Parliament reflected the new “dominant coalition” brought about by the Commercial Revolution: the king, the clergy, the nobility, two knights of the shires from each county, and two burgesses from selected boroughs.\(^{30}\)

The spread of borough liberties in the 12th and 13th centuries had resulted in a separation between boroughs’ and counties’ (shire) administrations, tax collection systems, and systems of local courts. This separation was particularly strong for boroughs that enjoyed self-governance (Farm Grants), and especially for those that had explicitly purchased the right to exclude the sheriff (e.g., the rights of non-intromittat and return of writs). Similarly, the jurisdiction of mesne boroughs was largely outside the reach of royal officials. At the same time, some mesne boroughs served as

\(^{30}\)Thus, all burgesses throughout the realm were represented in Parliament, either directly through their borough seats or indirectly via the two knights of the shire. In this context, it is important to note that by the late 13th century, kings and local lords were no longer in a position to give consent to extra-ordinary levies on their burgesses’ wealth (Mitchell, 1951); local lords could only consent to their own personal wealth being taxed. Burgesses consented to extra-ordinary taxes on their wealth via their (direct or indirect) representation in Parliament.
administrative centers of the surrounding mesne territory.\textsuperscript{31} In order to coordinate extra-ordinary taxation with a limited number of players, it made sense for the king to summon autonomous and administratively important royal and mesne boroughs directly to Parliament (Pollard, 1920, p. 112). By involving representatives of local communities in the approval for extra-ordinary taxation in Parliament, the king legitimized his request for funds, thereby fostering the cooperation of local administrations in the collection of taxes on movables (Hoyt, 1948).

Parliament was not sitting continuously. Instead, the king summoned it, typically when there was the need to raise extraordinary taxes for warfare. The king instructed the sheriffs to deliver a parliamentary \textit{writ of summon} to the boroughs located within the shire, independently of whether royal or mesne.\textsuperscript{32} The \textit{writs of summon} required boroughs to elect two MPs within a few weeks and to empower these representatives with \textit{plena potestas} (‘full powers’) to give consent to the king’s request for an extra-ordinary contribution (i.e., to legally bind their communities to pay the tax). To legitimize MPs’ authority in representing enfranchised boroughs, all male householders doing “watch and ward” (i.e., participating in the local system of peace-keeping) were entitled to vote for their MPs (Porritt, 1909, p. 5).

In the course of the 14th century, Parliament gained strength vis-à-vis the king. It increasingly acquired prerogatives in the areas of administration, justice, and finance. This evolution became evident in the first half of the 13th century, “and the year 1327, in which Parliament participated in the deposition of a king, divides as accurately as any single date can the phase when Parliament was still essentially a royal tool from that when it developed a political momentum of its own” (Harriss, 1981). By the 1330s, the Commons were separated from the Lords and, by 1376, they had a speaker. At the close of Edward III’s reign, most of the legislation was based on petitions made by the Commons, and statutes required the assent of Parliament (Harriss, 1981).

\section*{4 Data}

In this section, we describe the construction of the variables that are novel to the literature: borough level data on Medieval Farm Grants, parliamentary franchise, influence of the king on local politics, and geographic features. We also discuss the division into royal and mesne boroughs, and the extent to which these are comparable. The remaining outcome variables (e.g., votes for the Great Reform Act) are described briefly in the respective empirical sections below and in Appendix B.

\textsuperscript{31}Examples of administratively important mesne boroughs include Bletchingley, Lostwithiel, and Downton – the administrative centers of the Clare Family’s lands in Surrey, of the Duky of Cornwall, and of the ‘liberty’ of Downton Hundred, respectively (information from \url{https://www.historyofparliamentonline.org}). All three boroughs were summoned to Parliament by Edward I.

\textsuperscript{32}To the best of our knowledge, parliamentary \textit{writs of summon} did not distinguish between royal and mesne boroughs – c.f. McKisack (1962, p. 7), and Pasquet (1964, pp. 137-8).
4.1 Borough-Level Data in Post-Norman Conquest England

We collect data on the number of English boroughs, their foundation date, the nature of their ownership (royal vs. mesne), taxation, and local liberties between 1066 and 1348. This information comes mostly from the digitized version of original Medieval documents (e.g., charters and letter patents collected in the Pipe Rolls, Charter Rolls, Fine Rolls, Close Rolls, and Patent Rolls).

**Borough Ownership: Royal vs. Mesne.** To obtain the number of boroughs in existence by 1348, we use the primary data collected by Beresford and Finberg (1973) and Letters, Fernandes, Keene, and Myhill (2003). We know of 554 boroughs as of 1348, and we obtain information on whether these were owned by royal or mesne lords from the British History Online (https://www.british-history.ac.uk), Ballard (1913), and Ballard and Tait (1923). Our coding yields 145 royal and 409 mesne boroughs.

**Data on Charters of Liberties Granted to Boroughs.** We use the information on different charters of liberties (e.g., judicial, commercial, financial) contained in the collection of borough charters reported in Ballard (1913), Ballard and Tait (1923), and Weinbaum (1943). We further expand on the information in these datasets by coding liberties contained in the Charter Rolls, Close Rolls, Fine Rolls, and Patent Rolls of the reigns of Henry III, Edward I, Edward II, Edward III, and Richard II. For every borough, we document the charters it received with the date of the grant. Farm Grants were the most important liberties that boroughs could obtain. Figure 2 provides an overview of the farm grants obtained by royal and mesne boroughs. We also code whether a borough obtained restrictions on the entry of royal officials in judicial functions (non-intromittat), to enforce royal orders (return of writs), and in financial functions (direct access to the Exchequer).

**Parliamentary Franchise.** Beginning with the first English Parliaments summoned by Edward I, we record the date when boroughs gained parliamentary franchise. Until the 17th century, enfranchisement was a royal prerogative (Hawkyard, 1991). Enfranchisement was customary: If a borough was once summoned to Parliament, it could claim the right to representation forever after. We collect information on boroughs’ parliamentary franchise from the series of volumes...
Royal Influence on Local Politics. To code the king’s influence on local politics, we use election rules contained in boroughs’ Charters of Incorporation. Weinbaum (1943) provides this information for 157 boroughs in our dataset that were incorporated between 1345 and 1641. We create an indicator variable for strong royal influence that takes on value one if two conditions hold: i) the king appointed the first members of the governing body right after the borough’s incorporation, and ii) subsequent members of the governing body were selected by co-optation, thus perpetuating the initial influence of the king (see Appendix B.4 for detail). This coding yields 66 boroughs (42.0%) with strong royal influence.

Taxable Wealth in 1086, Geography, and Commercial Importance. We code the taxable wealth of urban settlements in 1086, which was assessed by the Normans and recorded in the Domesday Book (available at http://opendomesday.org). Appendix B.5 provides detailed information on the source and our coding. Taxable wealth is available for 354 boroughs in our sample, 85 royal and 269 mesne. To obtain geographic characteristics, we geocode the location of all boroughs as well as Medieval navigable rivers and Roman roads in use in the 11th and 12th centuries. We also compute two terrain controls: ruggedness and soil quality in a radius of 10 km around each borough. The sources for these geographic variables are listed in Appendix B.6. We code the commercial importance of Medieval boroughs based on two variables: whether a borough was among the 51 commercial centers in the mid-14th listed by Masschaele (1997) and whether a borough had obtained “freedom from tolls” – a grant that exempted its merchants from taxes on trade throughout the realm (see Appendix B.7 for detail). Finally, we also geocode the four historic pre-Norman kingdoms (Mercia, Wessex, Northumbria, and East Anglia) by relying on Hill (1981b).

4.2 Balancedness of Royal and Mesne Boroughs

As explained in Section 3, Farm Grants were almost exclusively granted by the king to royal boroughs, while they were largely absent in territories administered by mesne lords. This bears the question to what extent royal and mesne boroughs were actually comparable – could it be, for example, that the king “cherry-picked” commercially important towns after the Norman Conquest, so that mesne boroughs were mostly poor rural places? In what follows, we examine balancedness by using information that was available to the king when boroughs were distributed after the Conquest: geography and taxable wealth in 1086. Figure 4 shows the location of the 554 boroughs in our dataset. There does not seem to be spatial clustering – the 145 royal boroughs (solid squares), their seats in Parliament until 1830. In Appendix C.7 we show that our results are very similar when coding also those boroughs as enfranchised that were later denied re-enfranchisement.

and the 409 mesne boroughs (hollow dots) are distributed relatively evenly across England. This is likely a result of the king trying to ensure his influence across the realm. However, there is a tendency for royal boroughs to be located on rivers or Roman roads. We examine this systematically in Table 1. Columns 1-3 in Panel A show that 31% of royal boroughs were located on a navigable river, as compared to 13% among the mesne boroughs. The proportions for Roman roads are 44% vs. 28%. These differences are statistically significant (while for location on the sea coast, there is no significant difference).

A likely explanation for these differences is that the king needed to ensure that royal officials and troops could reach his boroughs, thus favoring locations on waterways and roads (Tait, 1936). This interpretation – as opposed to the king systematically picking the richest boroughs – is also supported by the data on taxable wealth of boroughs from the Domesday Book in 1086. Figure 5 shows that the distribution of taxable wealth was similar across royal boroughs (dashed line) and mesne boroughs (solid line). Panel B in Table 1 shows that royal boroughs were on average somewhat wealthier, with a p-value of 0.10. However, the average difference is mostly driven by the three richest boroughs (which were all royal). Once these are excluded, the p-value drops to 0.30. In addition, when controlling for the geographic features from Panel A, the p-value drops to 0.64, while the geographic variables are strong predictors of taxable wealth (see Appendix C.4 for detail). This suggests that there was no selection on borough wealth per se; instead, the king picked more accessible locations, which resulted in royal boroughs being somewhat richer due to an advantage in trade.

While the lack of geographic balancedness potentially raises concerns, we argue that this is unlikely to affect our results for two reasons: First, all our empirical results hold after controlling for royal status of boroughs, and also within the subset of royal boroughs. This means that ‘selection’ by the king does not directly affect our findings. Nevertheless, balancedness is still desirable when we use mesne boroughs as a ‘placebo’ (i.e., boroughs that looked otherwise similar to royal ones, but that very rarely got Farm Grants). This is where the next point comes in: Second, we can ‘create’ balancedness. As shown in Panel A in Table 1, there are in fact overall more mesne boroughs on navigable rivers, Roman roads, and on the sea coast. It is merely the proportion that is higher in royal territories. Thus, we can achieve balancedness by assigning lower weights to those mesne boroughs that are not on rivers, roads, or the sea. This is implemented by the Entropy balancing algorithm of Hainmueller and Xu (2013). The right part in Table 1 shows the results of rebalancing observations in the ‘control group’ (mesne boroughs) so that they match mean and variance of the three geography variables in the ‘treatment group’ (royal boroughs). After Entropy balancing, the means in the two groups are very similar and statistically indistinguishable, with p-values of 0.94 or higher. In Panel B, we show that balancing yields virtually identical means for taxable wealth (the higher precision results because now only one variable is involved, as opposed
to three in panel A). In the empirics below, we show that our results that use mesne boroughs as a ‘placebo’ are robust to Entropy balancing.

**Predictive Power of Geography in Royal and Mesne Boroughs.** In Appendix C.1 we perform an additional check that underlines the comparability of royal and mesne boroughs. Table A.1 shows that trade-favoring geography predicts economic activity in both royal and mesne territories, using three different indicators: taxable wealth in 1086, commercial importance in the 14th century, and city population in the mid-17th century (the first period for which population is available for a large number of boroughs). These findings supports our use of mesne boroughs as a ‘placebo’ region where Farm Grants were extremely rare, while other economic relationships that are central to our analysis were similar to those in royal boroughs.

5 Main Empirical Results: Farm Grants and Representation in Parliament

In this section we present our main empirical results. We begin by examining which boroughs received Farm Grants and then show that these are strong predictors of representation in Parliament.

5.1 Determinants of Farm Grants

We have already shown that Farm Grants were given almost exclusively to royal boroughs (see Section 3 and in particular Figure 2). In the following we show that this finding is extremely robust and not driven by differences across royal and mesne boroughs such as geography or wealth. We run the following regression for a cross-section of boroughs $i$, where the dependent variable is an indicator for a Farm Grant received before 1348:

$$FarmGrant_i = \alpha + \beta Royal_i + \gamma X_i + \delta Trade_i + \varepsilon_i,$$

where $\alpha$ is a constant term, $Royal_i$ is a dummy for royal ownership of borough $i$, and $X_i$ is vector of control variables, such as taxable wealth in 1086, terrain controls, and fixed effects for geographic units (either 4 pre-Norman kingdoms or the 40 English counties). $Trade_i$ denotes different geographic characteristics of a borough that favor trade: location on a navigable river, location on the sea coast, and location on a Roman road. Finally, $\varepsilon_i$ is the error term.

Table 2 presents the first set of results. Column 1 shows that royal boroughs were 47 percentage points (p.p.) more likely to receive Farm Grants, relative to an average of 16 percent across all boroughs. The (highly significant) coefficient corresponds to the difference shown in Figure 2. Could the relationship between $Royal$ and Farm Grants be driven by pre-existing differences, such as geography, culture, or local institutions? In what follows, we address this possibility in several ways. In column 2, we show that the coefficient on $Royal$ is virtually unchanged when we control for soil suitability and ruggedness, and include fixed effects for the four kingdoms that existed in England before the Norman Conquest (Wessex, Mercia, Northumbria, and East-Anglia). In fact,
all dummies for the pre-Norman kingdoms are individually statistically insignificant, and they are also jointly insignificant (with a p-value of 0.66). This suggests that there are no relevant regional differences dating back to the division of England before 1066 that later affected Farm Grants. Soil suitability is unrelated to Farm Grants, while there is a negative relationship with ruggedness. This is in line with our argument below that more remote places – with less trade – were less likely to receive Farm Grants. In column 3 we include county (shire) fixed effects. Again, the coefficient on Royal is unchanged.

Next, we use data on taxable wealth of boroughs in 1086, which is available for 354 boroughs in our sample. We thus first check whether our results in Table 2 also hold in this smaller subsample. Comparing column 4 with the same specification for the full sample in column 1, we see that the coefficient on Royal is very similar. Next, in column 5, we control for log taxable wealth (and for completeness, for soil suitability and ruggedness). The coefficient on Royal does not change, which implies that differences in wealth across royal and mesne boroughs (see Section 4.2) are not responsible for the fact that Farm Grants are almost exclusively observed in royal territories. We check this further in the following two columns: In column 6 we use entropy weights so that the mean and variance of Wealth are the same in royal and mesne boroughs (see Section 4.2); and in column 7 we use propensity score matching, comparing royal vs. mesne boroughs with similar or identical taxable wealth. In both cases, the coefficient on Royal is almost exactly the same as in our baseline specification in column 1. Finally, in column 8 we include an interaction term between taxable wealth and the status as a royal borough. This term is positive and significant, implying a total coefficient on taxable wealth of 0.118 in royal boroughs, as compared to 0.017 in mesne boroughs. To illustrate the magnitude, suppose that we first move a royal borough from the 10th to the 90th percentile of taxable wealth. This will raise its odds of receiving a Farm Grant by 38.0 p.p. (on top of a baseline probability of 26.5 percent, as indicated by the coefficient on Royal). In contrast, in mesne boroughs, the number is 5.3 p.p. (on top of a baseline probability of zero). We thus have two central findings: i) royal boroughs had on average a much higher chance to receive Farm Grants; ii) wealthier boroughs had a markedly larger incremental probability of receiving Farm Grants in royal territories.

**Geography-Based Proxies for Trade.** We now turn to the role of trade as a predictor of Farm Grants. Following our discussion in Section 3, we expect a positive effect of trade. Trade resulted in higher potential efficiency gains of self-administered tax collection and enforcement of commercial contracts (by elected officials with better local knowledge). We use three geographic variables as predictors for trade: A borough’s location on navigable rivers, on the sea coast, and on Roman roads.\(^\text{38}\) Table 3 shows that all three proxies for trade are significantly positively associated with

---

\(^{38}\)As Michaels and Rauch (2017) point out, the collapse of the Western Roman Empire in the 5th century AD temporarily ended urbanization in Britain. After the recovery in late Medieval times, towns in Britain were less
Farm Grants (col 1). The coefficients are larger when we restrict the sample to royal boroughs (col 2), and they are particularly strong for the two water-based proxies for trade. This is in line with estimates by Masschaele (1993) that in the 13th century, the cost of transporting goods by sea or by navigable river was about one-sixth the cost of road transport.

Next, column 3 in Table 3 restricts the sample to mesne boroughs, showing that there is, if anything, a small negative relationship between trade geography and (the few) Farm Grants that are observed in mesne territories. The coefficients on trade geography remain small and become statistically insignificant in column 4, where we use Entropy weights to create balanced geographic features in royal and mesne boroughs (see Section 4.2 and Table 1). The non-results for mesne boroughs imply that favorable trade locations did not experience an increased likelihood of self-governance when they were owned by local lords. We further underline the royal-mesne difference in column 5, where we use interactions of our three trade variables with the status as royal borough. The interaction terms are highly significant and positive, while the trade proxies themselves are small and negative. The same result holds in column 6, where we add county fixed effects, and in column 7, which uses Entropy weights. The interaction results underline that trade-favoring geography boosted the odds of obtaining Farm Grants only in royal boroughs.

Additional Results on Trade Geography and Wealth. In Appendix C.4 and C.5 we provide a number of additional results and robustness checks that we briefly discuss here. In Table A.3 we show that trade geography predicts taxable wealth in 1086, and that the relationship between trade and Farm Grants worked at least in part via taxable wealth – royal boroughs that were richer because of trade were also more likely to obtain Farm Grants. As expected, this effect is not present in mesne lords’ territories. In Table A.4 we show that boroughs with Farm Grants tended to be commercially more important already in the 14th century. This further supports our interpretation that commercially important towns had more to gain from self-administered tax collection. At the same time, it is coherent with Farm Grant boroughs thriving commercially, i.e., with a positive feedback from self-governance to economic performance.

frequently located on Roman roads, as compared to continental Europe. Instead, British towns often located on navigable waterways. Thus, our three proxies for trade capture both pre-existing infrastructure, as well as natural geography. Our main results hold when we use only navigable rivers and sea coast as proxies for trade. Also, despite its significant negative association with Farm Grants (see Table 2) we do not include ruggedness in our geography-based proxies for trade. The reason is that ruggedness also reduces agricultural productivity (Nunn and Puga, 2012).

39Mesne lords often had dwellings in the most important boroughs of their territories, giving them a strong degree of control over these towns. Thus, there were two opposing forces that can explain the zero (or slightly negative) net effect of trade geography: On the one hand, trading towns had more to gain from Farm Grants. On the other hand, in mesne territories, they were more likely to be under direct control of local lords, which made it less likely that those lords would grant them liberties (as in the example of the borough Arundel, discussed in footnote 27).
5.2 Farm Grants and Representation in Parliament

We now turn to the second step of our argument: The relationship between Farm Grants and representation in the English Parliament. We focus on the House of Commons, where boroughs and counties were represented.

**Background on Enfranchisement.** Figure 6 provides an overview of enfranchisement over time. By 1348 (using the same cutoff date as for Farm Grants), 130 boroughs had obtained seats in Parliament; 74 of these were royal, and 56 were mesne boroughs. The second and third bars show that the majority of boroughs with Farm Grants had obtained seats in Parliament (64 out of 90), while this proportion was much smaller among boroughs without Farm Grants (66 out of 464). In other words, seats in Parliament in 1348 were almost evenly split between boroughs with and without Farm Grants, despite the fact that there were much fewer of the former.

We argue that boroughs with Farm Grants were enfranchised because – given their self-governance – the king needed to seek their consent to extra-ordinary taxation in order to ensure their cooperation in levying the requested sum. But why did many boroughs without Farm Grants also receive seats in Parliament? The historical literature offers a variety of explanations. For some towns, other forms of administrative autonomy – for reasons unrelated to Farm Grants – led to their enfranchisement. For example, many enfranchised boroughs without Farm Grants belonged to mesne lords who had the right to exclude royal officials from their territories (Willard, 1934). Similarly, boroughs that played a strategic military role such as the Cinque Ports – which provided most of the royal naval service for warfare – were enfranchised even though not all of them had received Farm Grants. Starting in the 16th century, “strategic enfranchisement” of much less important boroughs also played a role: This reflected an attempt by the king to control the House of Commons by giving seats in Parliament to small rural boroughs that were under the close control of his allies (Plumb, 1969; Hawkyard, 1991). The right part of Figure 6 shows that in the later period, between 1349 and 1700, 73 additional boroughs were enfranchised, and the vast majority of these (62) did not have Farm Grants. In Appendix C.6 we provide empirical and historical evidence for “strategic enfranchisement.” We find that enfranchised boroughs without Farm Grants were particularly likely to become “rotten boroughs” (i.e., economically unimportant and under the close control of a local patron) – especially those enfranchised after 1348.

**Empirical Results.** We continue with our main empirical result, showing that there is a close (and likely causal) relationship between Farm Grants and enfranchisement in Parliament by 1348.

---

40Given his limited ability to tax these boroughs, and because parliamentary taxes were imposed on both royal and mesne boroughs (Mitchell, 1914; Willard, 1934), the king thus had an interest in summoning their representatives to Parliament in order to negotiate the taxes needed to fight wars (Levi, 1999).
We run the following regression:

\[ Enfranchised_i = \alpha + \beta FarmGrant_i + \gamma X_i + \varepsilon_i , \]

(2)

where \( \alpha \) is a constant term, \( X_i \) is a vector of control variables for borough \( i \) (such as royal status, terrain controls, and regional fixed effects), and \( \varepsilon_i \) is the error term. We run OLS and 2SLS specifications; the latter uses trade geography to predict \( FarmGrant \) in (2). Table 4 presents the results. Column 1 shows that there is a quantitatively large relationship in the raw data: Boroughs that had received Farm Grants were 46.6 percentage points more likely to be represented in Parliament – relative to an average share of 23 percent enfranchised among all boroughs. We also control for the status as royal borough; the coefficient is statistically significant but quantitatively much smaller than the one for Farm Grants. Column 2 shows that the results are almost identical when we control for county fixed effects and terrain characteristics, and the coefficient on Farm Grants is even larger when we restrict the sample to royal boroughs (col 3). In column 4, we present reduced-form results for royal boroughs, regressing enfranchisement directly on trade-favoring geography. All three variables are positive predictors, and they are jointly highly significant with a p-value of 0.008. Next, we perform two analyses to examine whether this reduced-form relationship works via Farm Grants. First, in column 5, we add Farm Grants as a regressor. The coefficient is almost identical to the previous regressions, while the three trade variables become quantitatively small and individually and jointly insignificant. This suggests that the relationship between trade geography and representation in Parliament works via Farm Grants.41 Second, in column 6, we present 2SLS results, using trade geography to predict Farm Grants in royal boroughs. We find a highly significant coefficient on (predicted) Farm Grants that is quantitatively very similar to the OLS specification in column 3. While this result lends support to a trade–self-governance–enfranchisement channel, it is subject to a limitation: Other factors that are associated with trade geography (such as higher wealth or better connections to the central authority) may have affected representation in Parliament independent of Farm Grants. In what follows, we extend our analysis to account for this possibility.

**Checking the ‘Exclusion Restriction.’** The ‘exclusion restriction’ in the above 2SLS specification is that trade geography affected enfranchisement only via Farm Grants. To check whether this holds in our data, we use mesne boroughs – where Farm Grants were rarely granted. Focusing on mesne boroughs, we can thus examine if trade geography is related to enfranchisement in the absence of Farm Grants. Column 7 in Table 4 shows that there is essentially no (if anything, a small

---

41 This specification must be interpreted with caution due to correlated regressors. However, note that all explanatory variables are dummies and that, if anything, Farm Grants (based on historical records) are more prone to measurement error than geographic features of boroughs. Thus, the “bad control problem” (Angrist and Pischke, 2009) is unlikely to drive the strong coefficient on Farm Grants.
negative) relationship between trade geography and enfranchisement. The same is true in column 8, where we use Entropy weights to create balancedness between royal and mesne boroughs. Thus, in the absence of Farm Grants, trade-favoring geography does not predict representation in Parliament (while it does predict other economic outcomes, as we have shown in Table A.1). The non-result for mesne boroughs makes it unlikely that our findings for royal boroughs are driven by unobserved correlates of trade geography – provided that mesne boroughs are a valid ‘placebo,’ which we discuss in more detail below.

The last two columns in Table 4 perform 2SLS analyses in the full sample. Column 9 uses the three geographic variables as well as their interaction with Royal to predict Farm Grants, showing a highly significant coefficient in the second stage that is similar in magnitude to the OLS results. In column 10, we perform a particularly restrictive exercise: To predict Farm Grants, we use only the interaction terms of trade geography with Royal, and we include all level variables (i.e., navigable river, sea coast, Roman road, and Royal) as controls. This specification is akin to a difference-in-differences setup, with differences in trade geography as well as in the possibility to obtain Farm Grants (i.e., royal status). The small and insignificant coefficients on the geography variables (with a joint p-value of 0.97) suggest that trade did not affect enfranchisement directly. This lends further support to our argument that Farm Grants were a ‘stepping stone’ on the way into Parliament.

Our test of the ‘exclusion restriction’ assumes that royal and mesne boroughs are comparable. While Figure 5 has shown that this is approximately true for taxable wealth in 1086, the figure also reveals that the wealthiest boroughs (with taxable wealth above 50) tended to be royal. This raises the concern that these rich boroughs may have been more likely to receive Farm Grants and to be enfranchised, which could drive our results. In columns 1-4 of Table 5 we exclude all boroughs with wealth above 50. Both the OLS and the 2SLS specifications (cols 1 and 2) show coefficients on Farm Grants that are almost identical to the full sample in Table 4. Next, column 3 uses propensity score matching based on taxable wealth in 1086 and the status as a royal borough. For each royal (mesne) borough, the algorithm matches the two boroughs with the same ownership status that have the most similar taxable wealth. The coefficient on Farm Grants is statistically significant and of similar magnitude as in our main results. In column 4, we perform a particularly restrictive analysis: We match by ownership status and population in 1290, which is available from Campbell (2008) for 60 boroughs in our sample; this is the most comprehensive source of borough population before 1348. After excluding the wealthiest boroughs, 52 observations remain. Even in this subsample, the coefficient on Farm Grants is almost identical to our main results: Boroughs with Farm Grants were 49.7 p.p. more likely to be enfranchised than towns without Farm Grants of the same ownership status and the same (or similar) population size. In columns 5-8 we further restrict the sample, including only boroughs with taxable wealth below the 90th percentile (corresponding to wealth below 25 in Figure 5), and towns whose (known)
population size in 1290 was below 10,000 (corresponding to the 90th percentile of cities with known population). We repeat the previous OLS, 2SLS, and matching specifications. Even in this highly restrictive setting, the coefficients on Farm Grant are essentially unchanged. Thus, the strong positive relationship between Farm Grants and enfranchisement is not driven by the largest or richest boroughs.

Additional Results on Enfranchisement, and Organizational Capacity. We argue that Farm Grants made enfranchisement more likely because it was harder for the king to unilaterally impose extraordinary taxation in boroughs with self-governance. Autonomous towns had to be persuaded to cooperate in financing national projects. We expect this to be particularly true for boroughs that did not only have Farm Grants but also additional liberties that restricted the entry of royal officials in judicial, financial, or law-enforcing functions. Figure 7 analyzes this dimension. By 1348, 90 boroughs held Farm Grants, and among these, 39 had obtained additional liberties that restricted the entry of royal officials. In these 39 towns, it was in practice very difficult for the king to levy extra-ordinary taxes without the local community’s cooperation. Correspondingly, we find that 87.1% of the boroughs with Farm Grants and restrictions on royal officials were represented in Parliament by 1348. Among the 51 boroughs that had Farm Grants but no restrictions on entry by royal officials, 58.8% were represented in Parliament. While these towns had their own (locally elected) tax collectors, the king could still send his officials to enforce royal orders. Thus, these towns had a less autonomous position vis-à-vis the royal administration, which can explain their lower representation in Parliament. Nevertheless, towns with (only) Farm Grants were still substantially more likely to be represented in Parliament than those without: Among the boroughs without Farm Grants, only 14.2% had seats in Parliament.

Appendix C.7 provides additional results on parliamentary representation. It shows that our results also hold for boroughs’ representation in the ‘Model Parliament’ of 1295 and for enfranchisement in 1700. In addition, we show that longer duration of Farm Grants before 1348 was strongly associated with enfranchisement. Finally, we examine whether our results may be driven by (unobserved) organizational capacity. For example, well-organized merchants may have been more successful at lobbying the king for both Farm Grants and representation in Parliament. We address this issue in Appendix C.8, using two types of Charters of Liberties as proxies for the organizational capacity of boroughs: the right to elect officials (other than via Farm Grants) and rights to collect Murage or Pavage (funds used to repair town walls and streets). Controlling for these variables does not change our results on enfranchisement, and the coefficients on the two proxies are significantly smaller than those for Farm Grants. These results fit a broader context, in line with González de Lara et al. (2008), where the capacity to organize and obtain liberties increased the autonomy of boroughs, with Farm Grants being the most important rights of self-administration (and thus also the strongest predictor of enfranchisement). Finally, Appendix C.9 shows that our
results are robust to controlling for pre-Norman fortified towns and for towns that already had the status of ‘borough’ at the time of the Norman Conquest. In fact, our results remain almost identical when we exclude the 100 ‘Domesday boroughs.’

6 Farm Grants and Institutional Outcomes after 1400

In this section we examine the relationship between Medieval Farm Grants and institutional dynamics in the long-run, over five centuries after 1348. In particular, we show that towns with Medieval Farm Grants enjoyed more independence and open local institutions and that they played a role in the gradual strengthening of the English Parliament. We use the same regression setup as in (2), but replace the dependent variable with different institutional outcomes.

6.1 Independence of Boroughs Politics in the 15-17th Century

We begin by examining the independence of boroughs from the king in appointing their local officials between the 15th and 17th century. During this period, many boroughs became Municipal Corporations. Formally, both royal and mesne boroughs paid to receive a Charter of Incorporation from the king (in the case of mesne boroughs, with the approval of the local lord). These charters sanctioned the new local governance structure, typically made of a mayor, a council of aldermen, and a larger common council (Tait, 1936). In principle, Charters of Incorporation confirmed previously-issued liberties (Weinbaum, 1943). However, by the 17th century kings increasingly attempted to meddle with towns’ liberties, by restricting their autonomy in the newly issued Charters of Incorporation. Charles I tried to install a narrower oligarchy composed of members whose preferences were aligned with the royal policy. Some towns successfully resisted this royal interference (Patterson, 2005). In what follows, we show that Farm Grant boroughs were particularly likely to keep their independence from the king.

Using information from the original Charters or Incorporation, we construct the dependent variable influence king as described in Section 4.1. Table 6 presents our results. The sample includes only those 158 boroughs that received Charters of Incorporation by 1660 (77 royal and 81 mesne). We find that boroughs with Farm Grants were 22 p.p. less likely than other boroughs to be subject to strong influence of the king (col 1). For comparison, the average proportion of

42 Signs of royal interference with municipal councils are observed as early as the 15th century. In York – whose Farm Grant dated back to the 12th century – Richard III attempted to install a narrow oligarchy and exclude the freemen from choosing borough officials. The Common Council, which was representative of the body of freemen, reacted by introducing a bill that asserted that borough officials’ offices were not for sale, but rather were “to be chosen and elect by the mayre and his brether and with thassent of the commons” (as cited in Carpenter, 2000). A further example is available from the Civil War period: In 1628, Charles I started a legal proceeding (quo warranto) against the corporation of Great Yarmouth, whose Farm Grant dated back to 1208. A new Charter of Incorporation followed suit in 1629. This Charter reduced the governing body by half and limited its membership to those members who favored Charles’ policy. The town’s council immediately assembled and decided to legally challenge the new Charter by majority voting, thereby opposing its implementation. Eventually, after more than 10 years of (legal) struggle, Charles I was forced to reconfirm the original Charter (Patterson, 2005).
burghs with strong influence of the king is 42%. Since Charters of Incorporations were granted by the king, we control for royal ownership of boroughs. This variable is quantitatively small and statistically insignificant – a likely explanation is that the distinction between Medieval royal and mesne boroughs lost importance with the decline of feudalism in the early modern period (Cam, 1940). Our results are robust to including county fixed effects and terrain controls in column 2. Column 3 presents 2SLS results, using the trade geography variables and their interaction with Royal to predict Farm Grants. The coefficient is statistically significant and somewhat larger than its OLS counterpart. However, due to the reduced sample size of incorporated boroughs, a weak first stage is a concern, so that the coefficient size must be interpreted with caution. Overall, the results in Table 6 suggest that nearly three centuries of self-governance enabled Farm Grant boroughs to resist the king’s meddling in their internal affairs.

6.2 The Civil War

By the beginning of the 17th century, the English king was seeking additional revenues. Income from the royal demesne and customs on international trade had become insufficient to cover the accumulated debts and the costs of government. The king sought consent on additional taxes on movables from Parliament, even in times of peace. This amounted to enlarging the old definition of a ‘case of necessity,’ effectively eliminating the distinction between ordinary and extra-ordinary taxation, resulting in a constitutional crisis (Hill, 1981a; Lindquist, 1985). Despite the king’s increasing meddling with enfranchised boroughs’ internal affairs, the Commons proved unmanageable and constantly denied royal requests for funding. As a direct consequence, by 1629 Charles I no longer summoned Parliament and instead resorted to prerogative taxation such as Ship Money, forced loans, and the purveyance of goods (Hill, 1981a). Charles also introduced highly controversial religious measures, which raised suspicions that he was reintroducing Catholicism. The disastrous outcome of the first Bishops’ War (1639) triggered a chain of events that escalated in a civil war.

The English Civil War (1642-1646 and 1648-49) and the events following it ultimately strengthened the English Parliament, paving the way to an institutional divergence between England and most of Europe (Van Zanden et al., 2012). In the events leading up to the Civil War, Parliament issued the Militia Ordinance without royal approval to raise troops in support of its cause. As a response, the king issued the Commissions of Array to raise his own men. The choice whether to obey the Militia Ordinance or the Commissions of Array often forced local officials, lords, and burgesses to pick a side. The parliamentary records from 1642 mention 30 boroughs whose volunteer troops (in support of parliamentarians) were sufficiently important to be explicitly discussed in Parliament. We create the dummy variable Volunteers for these boroughs. An important motivation to oppose the king during the Civil War was the concern that the crown would increase its power relative to the other members of the dominant coalition in Parliament, which included mer-
chant towns (North et al., 2009). Presumably, a weakening of Parliament would have jeopardized towns’ liberties by making them vulnerable to royal interferences. In addition, in Farm Grant boroughs, the eventual rebel elite was more likely to enjoy sufficient administrative autonomy to organize military action against the king. For these reasons, we expect a positive relationship between Medieval Farm Grants and Volunteers. Appendix B.9 provides further detail on the data and more background information on the Civil War.

Figure 8 illustrates our result for the Civil War: Among the boroughs with Farm Grants, 23% raised volunteer troops, while less than 2% of all other boroughs did so. Table 7 presents the corresponding regression results. We begin with the full sample in column 1. We find that boroughs with Medieval Farm Grants were 20 p.p. more likely to raise pro-parliamentarian troops, relative to a sample mean of 5.5%. In column 2 we control for county fixed effects and terrain characteristics; in column 3, we restrict the sample to royal boroughs. Both specifications confirm the strong positive coefficient on Farm Grants. Because incentives to support Parliament may have been larger for enfranchised boroughs, we next restrict the sample to those 189 boroughs in our dataset that existed by 1348 and had seats in Parliament by 1640. Out of these, 28 raised volunteers. The coefficient on Farm Grants is almost identical to the full sample (col 4); it is also similar in the (even smaller) subsample of 91 royal boroughs that were enfranchised by 1640 (col 5). Thus, results for enfranchised boroughs reflect those in the full sample, and we use the latter for our final analysis: Column 6 reports 2SLS results that use trade geography (and its interaction with Royal) to predict Farm Grants; column 7 uses only the interaction terms to predict Farm Grants, controlling for the variables in levels.

43 At the same time, many towns were reluctant to openly fight the king, since their liberties could have been revoked by the crown in case of defeat. This ambivalence may in part explain why burgesses were divided during the Civil War, even within boroughs (Howell, 1979, 1982). In addition, previous research has shown that individual MPs often followed their private interests (such as overseas stock holdings or personal monopolies issued by the king) when deciding to support the king or parliamentarians during the Civil War (Jha, 2015). This often led to MPs from the same borough supporting opposite sides: Among the 194 boroughs with more than one MP, 80 saw split support (we are grateful to Saumitra Jha for sharing his data with us). Consequently, individual MP behavior is not a strong indicator for borough-level preferences during the Civil War.

44 We also control for Royal as a potentially important determinant for support for the king. However, the coefficient is small and insignificant, which is coherent with the declining distinction between royal and mesne boroughs in the early modern period (Cam, 1940). Note that the sample size is 550 boroughs in the 17th century. This is because four boroughs disappeared or were merged with other settlements after 1348 (see Appendix B.3). We do not include locations that obtained borough status after 1348 in any of our regressions.

45 Note that we only present the second 2SLS specification for outcomes that use the full sample of boroughs (enfranchisement and Civil War). All other long-run outcomes examine subsamples – those boroughs that received Charters of Incorporation (Table 6) or were represented in Parliament (Tables 8 and 9). In these cases, the more restrictive 2SLS lacks power. Similarly, we only present the reduced form results separately for royal and mesne boroughs in the full sample (for enfranchisement in Table 4 cols 4 and 8, and for the Civil War in Table A.11 in the appendix). For the other long-run outcomes, the reduced form is less informative because it effectively involves two ‘steps’ – i.e., geography first predicting enfranchisement itself, and second, the parliamentary outcomes within the subsample of enfranchised boroughs.
6.3 Voting Rights in MP Elections

As a result of the Civil War and the Glorious Revolution, England became a constitutional monarchy. In the period leading up to the Great Reform Act of 1832, the main threat to the functioning of Parliament was the rampant patronage – that is, the ability to nominate and control MPs by the king and his allied landed elites, not only in England but also in Continental Europe (c.f. Kettering, 1987). This period witnessed a general tendency for boroughs to be run by closed oligarchies. Nevertheless, local franchise rules concerning MP elections exhibited significant variation across boroughs. In what follows, we test the hypothesis that Medieval Farm Grants also led to broader voting rights in elections of Members of Parliament over the subsequent centuries. We first present results for 1820-31 – the period with the most complete data. We then study earlier periods, going back to the early 17th century. In our main analysis, we use several indicators for broad voting rights over the period 1820-31: i) Openness Index: an index from 1-3 for how “open” MP elections were for candidates to run – the extent to which a borough’s choice of MP candidates was subject to the control of a patron; ii) Contested Elections: the number of contested elections (out of a total of four) over the period 1820-31, i.e., MP elections for which there were more candidates than seats for a borough; iii) Broad Franchise: a dummy variable that takes on value 0 if the borough had a “narrow franchise” where the right to vote for MPs was attached to land holdings or titles, and value 1 otherwise. This variable reflects the breadth of the electorate that voted for MPs; iv) Patronage Index: This index ranges from 0 (closed constituency, controlled by a local patron) to 2 (open constituency without patronage). The third and fourth variable are from Aidt and Franck (2015). All four variables are coded such that higher values indicate MP elections with broader voting rights; Appendix B.8 provides further detail. All regressions use only the subset of 185 boroughs that had seats in Parliament in 1820-31 and for which data are available.

**Results for 1820-31.** Columns 1-4 of Table 8 show that Medieval Farm Grants are a strong predictor of all four indicators for broader voting rights. The coefficients on Farm Grants are statistically highly significant. In terms of magnitude, Farm Grants account for about one-third of the average of the various measures. In columns 5-9, we combine the four measures into their first principal component and run a number of additional checks. Column 5 shows a strong positive coefficient on Farm Grants, corresponding to 0.67 standard deviations of the dependent variable. In column 6 we include several controls used by Aidt and Franck (2015). In column 7 we restrict the sample to royal boroughs, and in column 8 we include county fixed effects and terrain

---

46 We thank Toke Aidt and Raphaël Franck for kindly sharing their data. The controls include market integration (travel distance between any given constituency and the 243 other constituencies weighted by the population), distance to urban center (travel days from each constituency to the nearest of the 13 largest towns in 1831), Connection to London (graphical, economic, and informational connections to London), and a dummy for boroughs controlled by the treasury. Aidt and Franck (2015) also control for borough population. Since this is an endogenous outcome of commercial activity that is also predicted by trade-favoring geography (see Table A.1), we do not include this variable.
controls. Finally, in column 9 we present 2SLS results using the trade geography variables and their interaction with *Royal* to predict Farm Grants. All specifications yield highly significant coefficients of similar magnitude.

**Results for 1604-1831.** In Appendix C.10 we show that the relationship between Farm Grants and broader voting rights in MP elections holds with continuity between the early 17th and 19th century. The available historical sources allow us to extend the *Openness* measure back to 1690, and the *Broad Franchise* measure back to 1604.\(^{47}\) Tables A.9 and A.10 present the results. Throughout the various time periods, we find that among the boroughs that were represented in Parliament, those with Medieval Farm Grants were significantly more open in terms of nominating candidates for MP seats, and had a broader electorate that voted for MP candidates.

### 6.4 The Great Reform Act of 1832

The rules governing Parliament and its composition were largely unchanged from the 17th century to the Reform Act of 1832 (Porritt, 1909). The beginning of the 19th century was marked by profound discontent with local governance and MP elections (Lizzierì and Persico, 2004). The parliamentary system was perceived as corrupt (Brock, 1973, pp. 25-8), and many newly industrialized boroughs lacked direct representation (e.g., Manchester). The Great Reform Act of 1832 – a milestone towards the modernization and democratization of the UK Parliament – addressed these issues by implementing major changes: i) disenfranchising smaller “rotten” boroughs, while enfranchising the newly industrialized ones (e.g., Manchester), and ii) harmonizing the franchise across boroughs, which resulted in an extension of the franchise from 3% to more than 6% of the population. The first Bill was proposed in March 1831, and although approved by the House of Commons by a narrow margin, was then rejected by the House of Lords. This event prompted the collapse of the Government and new MP elections (held in April 1831). Importantly, the MPs that voted in March 1831 had been appointed by their constituencies to vote on a variety of other major issues such as Catholic emancipation, slavery, and the Corn Laws (Fisher, 2009; Brock, 1973). In contrast, the general elections of April 1831 were effectively a referendum on the parliamentary reform, closely tying MPs to their constituencies’ preferences on the Reform Act. Two bills were proposed in June and September 1831 and, after some amendments and compromises, a new bill was voted in December 1831 and finally approved in March 1832. Appendix B.10 provides further historical detail.

We focus on the two voting rounds on the Reform Act in March and December 1831. For these two voting rounds, we record the voting behavior of each borough’s MPs from the Parliamentary Papers (available at [https://parlipapers.proquest.com/parlipapers](https://parlipapers.proquest.com/parlipapers)) and compute the share of votes in favor of the Reform Act. We also record whether the borough was to be totally or partially

\(^{47}\)See Appendix B.8 for detail on the sources and the coding of *Openness* and *Broad Franchise*. 

---

30
disenfranchised (Section A and B boroughs). In addition, we merge borough-level characteristics (see footnote 46) and a dummy for whether a borough was located in proximity to the peasants’ Swing Riots (collected by Aidt and Franck, 2015).

Table 9 presents our empirical results. Column 1 shows that there is essentially no relationship between Farm Grants and pro-reform votes in March 1831, i.e., for the vote by MPs who had been elected based on other issues, before the Reform Act became the major topic. Starting from column 2, we focus on the decisive vote in December 1831, when MPs had been specifically appointed to vote on the Great Reform Act, so that their mandate was closely tied to their borough’s preferences on parliamentary reform. Column 2 shows that Medieval Farm Grants are a strong predictor of voting behavior of MPs. The coefficient is also quantitatively important: Support was about 17 p.p. higher among boroughs with Medieval Farm Grants, relative to an average level of support of 56 percent among the boroughs with representatives in Parliament in 1831. We also control for whether a borough was to be disenfranchised; as expected, the coefficient is strongly negative.

Next, in column 3 of Table 9 we also control for the vote in March 1831. Thus, we effectively exploit the change in voting behavior after the newly appointed MPs were closely tied to their borough’s preferences on the reform. This specification implicitly controls for unobserved political preferences that were already reflected in the appointment of the MPs that had voted in March. While the coefficient on the March vote is large and significant, the coefficient on Farm Grants remains almost unchanged. This suggests that omitted variables related to other political preferences do not confound our results. We also add a control for whether a borough was located in proximity to rural Swing Riots and thus felt a “threat of revolution” (Aidt and Franck, 2015). The coefficient is slightly smaller than the one on Farm Grants (but the two are statistically indistinguishable). In column 4 we restrict the sample to boroughs that were royal in Medieval times. All previous results hold. The same is true in column 5, where we add county fixed effects and additional controls for borough characteristics. Columns 6 and 7 present 2SLS results, using trade geography interacted with the Medieval status as a royal borough to predict Farm Grants. We confirm the OLS results in both magnitude and significance.

What explains the pro-reform voting of boroughs that had received Farm Grants in Medieval times? We provide three (possibly complementary) explanations: First, in line with North et al. (2009), Parliament adapted itself to reflect England’s new coalition of power holders that had emerged during the Industrial Revolution. The incentives of newly industrialized towns (that were to be enfranchised by the Reform Act) were aligned with those of established commercial towns.48 As a result, it is plausible that merchants in boroughs with Medieval Farm Grants pushed their

---

48 Boroughs that were commercially more developed in Medieval times were still more reliant on trade in the 1830s. To show this, we regress the share of employment in trade-related professions in 1831 (coded by Aidt and Franck, 2015, based on the 1831 census) on Medieval Farm Grants in the same sample as used in Table 9. We obtain a highly significant coefficient of 0.075 (s.e. 0.019), relative to a standard deviation in trade employment of 0.129.
MPs to support a strengthening of the pro-trade coalition in Parliament. Second, relatedly, the boroughs with medieval Farm Grants – whose internal institutions had remained more open – had a natural interest in preventing the landed interest from undermining the functioning and legitimacy of Parliament through patronage. Our third explanation is related to boroughs’ internal politics. In line with Lizzeri and Persico (2004), when pork barrel politics prevail, the local elite in power has an incentive to extend the franchise under two conditions: i) a substantial need for public good provision and ii) a relatively large elite with electoral power (so that swing voters must content themselves with small bribes). Consistent with this rationale, the Industrial Revolution increased the demand for public goods (e.g., better sanitation systems). Moreover, as we showed in Section 6.3, boroughs with Farm Grants had indeed broader voting rights in their MP elections.

6.5 Obstruction of Trade after Farm Grants

A potential concern with our findings is that trade affected institutional outcomes directly, and not only via Farm Grants. We have addressed this possibility above, using mesne boroughs as a ‘placebo.’ For some of our long-run outcomes, there are limitations to this approach (see footnote 45). In what follows, we thus provide an additional placebo exercise, showing that Farm Grants predict long-run institutional outcomes after 1348 even in the absence of trade. We code an indicator for boroughs in which exogenous shocks obstructed trade after they had received Farm Grants. We focus on two types of shocks to transportation infrastructure: First, natural disasters – the silt-ing up or destruction of harbors located on the sea coast (in the spirit of Jha, 2013), and second, the obstructions of parts of navigable rivers due to watermills (and the associated milldams) that were erected upstream or downstream of boroughs. Particularly severe shocks or obstructions of trade triggered petitions by burgesses asking for subsidies for repairs or tax reductions. Information on these petitions is available from the History of Parliament. Among the 90 boroughs with Medieval Farm Grants, 17 suffered trade obstructions between the 13th and 17th centuries – all occurred after these boroughs had received a Farm Grant. Appendix C.12 provides further detail.

In Table 10 we split boroughs with Medieval Farm Grants into those with and without trade obstructions. The first two columns perform a plausibility check: Columns 1 and 2 show that in Medieval times, Farm Grants are strongly correlated with taxable wealth and commercial importance – with similar coefficient sizes for boroughs with and without (later) trade obstructions. In contrast, in the 18th and 19th century, only Farm Grants without trade obstructions predict commercial employment (col 3) and borough population (col 4). In other words, the boroughs that later suffered trade obstructions started off with very similar wealth and commercialism as all other Farm Grant boroughs, but they lost their commercial and population lead in the centuries after their trade was obstructed. Thus, if trade had a direct effect on long-run institutional outcomes, this channel should be switched off in those boroughs. Columns 5-7 in Table 10 re-examine our long-run outcomes after the 17th century. We find that even when trade was obstructed, Farm
Grants predict volunteer troops during the Civil War in 1642, broad franchise of MP elections in 1820-31, and support for the Great Reform Act. The coefficient sizes are statistically significant and similar in magnitude for both Farm Grants with and without trade obstruction – despite the fact that there are fewer boroughs in the former set.\(^{49}\) These results make it unlikely that unobservables that are correlated with trade (in royal boroughs only) confound our results.

6.6 Matching, Spatial Correlation, Taxable Wealth

In the appendix, we perform a number of robustness checks of our results for the various outcome variables from Tables 4-9. Appendix C.13 replicates our main results, accounting for possible spatial dependence of error terms. Appendix C.14 shows that all our results hold when we control for taxable wealth in 1086, and when we exclude the top-10 percentile of richest and most populous cities. Appendix C.15 provides matching estimates: We match, to each ‘treated’ royal borough with a Farm Grant, two ‘control’ mesne boroughs (without Farm Grants) with exactly the same trade geography. All specifications confirm our results, both in terms of magnitude and significance.

7 Taking Stock: Municipal Liberties and Assemblies in Western Europe

In this section, we discuss the extent to which the chain of events that we described for England was relevant in other regions of Western Europe. We distinguish between the “entering-parliament” channel (whereby trading towns’ autonomy led to their representation in parliaments) and the “strengthening-parliament” mechanism (self-administered towns defending parliaments against patronage by kings and landed elites). We document historical evidence that elements of the entering-parliament channel were at play throughout Western Europe – albeit to a varying degree. On the other hand, the “strengthening-parliament” mechanism was uniquely strong in England, arguably due to the relatively homogenous institutional landscape after the Norman Conquest, which aligned the interests of Farm Grant boroughs in supporting Parliament. In what follows, we present an overview. Appendix D provides a detailed discussion and additional historical background for each of the countries and regions mentioned below.

**Overview.** By and large, the entering-parliament mechanism also operated in France and Spain, although the local military and landed nobility had a stronger influence in municipal offices than in England, where self-governed towns were largely ran by merchants (see for instance Tait, 1936, pp. 296-7). In contrast, in Flanders and Northern Italy, (almost fully) decentralized military power fostered the emergence of strong independent cities. In Flanders, this concentrated the power in parliament in the hands of the three main cities (Trois Villes); in Northern Italy, cities became

\(^{49}\)Among the 17 boroughs that suffered trade obstructions after receiving Farm Grants, five obstructions occurred before 1348 (but after Farm Grants were obtained by these boroughs). Table A.12 in the appendix shows that the results also hold when we exclude these boroughs.
fully independent from the king, and therefore did not even gather in (his) parliament. Finally, we analyze Sicily, where the overwhelming strength of local lords and the small size of their territories suffocated municipal liberties and ultimately merchants’ representation in general assemblies. We conclude that for the entering-parliament mechanism to operate after the Commercial Revolution, two key pre-conditions had to be met: First, the sovereign’s territory had to be relatively large, so that administrative tasks such as tax collection needed to be delegated. Delegation to royal officials created administrative inefficiencies, which in turn were resolved by granting towns the right of autonomous tax collection. Given the large territories, parliaments allowed for coordination of taxation across the realm. Second, military capacity had to be concentrated in the hands of the central power. This prevented that towns gained full independence – which otherwise (for example in Italy) reduced the king’s ability to summon them to parliament (Blockmans, 1978).

We documented that Farm Grant boroughs in England supported Parliament during the Civil War in the 17th century, reflecting the “strengthening-parliament” mechanism. All over Europe, this period was characterized by monarchs imposing higher taxes to finance the increased cost of warfare (Gennaioli and Voth, 2015). Where they were represented in parliaments, towns tried to resist these demands for extra-ordinary taxes (Russell, 1982). Kings sought to gain the upper hand by cooperating with local landed and military elites, offering them lucrative positions as tax farmers in exchange for their loyalty. This system of patronage was successfully installed in France and Spain, where local landed and military elites had historically been relatively strong vis-à-vis the merchant class. As a result, the nobility took over towns’ local governments (alongside royal officials), and France and Spain converged towards ‘absolutism’ – effectively a return to tax farming, with local oligarchies shifting the burden of taxation onto burgesses. Because both the king and the towns’ new closed oligarchies benefitted from this ‘tax agreement,’ representative assemblies became obsolete and tended to disappear in France and Spain (Jago, 1981; Beik, 2005).50 In England, in contrast, the local nobility had little military power (and was never exempt from taxation); instead, a relatively open merchant elite governed towns – especially those with Medieval Farm Grants. Thus, the king lacked strong local allies in his attempts to install a patronage-based system of tax collection. As we documented above, Farm Grant boroughs managed to maintain their independence of the king in appointing local officials, and they contributed to strengthening Parliament during the seventeenth century. Thus, medieval Farm Grants arguably contributed to the unique strength of the English Parliament during the 17th and 18th century.

50Other studies have argued that heterogeneity across French regions prevented the well-functioning of the Estates General (Strayer and Taylor, 1939; Barzel and Kiser, 1997). In England, in contrast, the Norman Conquest had homogenized the political landscape. This arguably facilitated the cooperation of merchant towns from different regions.
8 Conclusion

After centuries of stagnation in the “Dark Ages,” economic activity in Western Europe began to grow in the 11th century. The Commercial Revolution brought about a surge in trade, fostering urbanization. The rise of trade and commerce coincided with the emergence of municipal self-governance, granted by sovereigns across Western Europe to trading towns in their realms. The period also saw the evolution of Medieval assemblies into parliaments, where merchant towns gained direct representation. We argue that the concurrent emergence of trading towns’ self-governance and their representation in parliaments is not a historical coincidence: Municipal autonomy was an important stepping stone for the parliamentary representation of the merchant class.

We focus on the prominent case of England, assembling a new, uniquely rich historical dataset. We begin our analysis with the Norman Conquest of 1066, which resulted in relatively homogeneous formal institutions. We develop a two-step argument to explain how merchant towns gained representation in Parliament. In the first step, we study the process by which merchant towns obtained the right of self-governance. While Medieval English kings exerted strong military control over the royal territory, their administration was relatively inefficient. Royal officials who acted as tax farmers abused their power, and they lacked specialized knowledge when enforcing commercial contracts. The resulting distortions became particularly severe in trading towns during the Commercial Revolution. Farm Grants – the right to self-administer tax collection and law enforcement – offered a mutually beneficial solution for merchant towns and the king. Thus, the boom in economic activity led to the emergence of municipal self-governance. In the second step, we relate self-governance to towns’ representation in Parliament by 1348. Parliament discussed and gave consent to extra-ordinary taxation. The administrative autonomy of towns with Farm Grants made it harder for the king to unilaterally levy extra-ordinary taxes; instead, he had to seek the cooperation of these communities by involving them in the decision process in Parliament. Correspondingly, we find that towns with Farm Grants were significantly more likely to be enfranchised.

Farm Grants shaped the institutional landscape throughout the subsequent centuries. In the 16th and 17th centuries, the governing bodies of Farm Grant boroughs resisted royal attempts to interfere with their liberties. These attempts became particularly intense in the years preceding the outbreak of the Civil War: by then, the king was trying to impose narrow oligarchies acting as tax farmers in towns. Boroughs with medieval Farm Grants managed to maintain a more autonomous and relatively open local administration throughout this turbulent period. Parliament was vital in this power struggle, because it allowed these relatively homogenous and self-governing entities to coordinate, thereby exerting an effective constraint on the king.\footnote{For example, James I tried to re-introduce a system of tax farming by granting numerous monopoly rights to individuals in different towns across the realm, empowering them (among other rights) to levy tolls and run the borough market. The Commons voiced numerous complaints in the Parliament of 1621 and succeeded in containing}
Grant boroughs took steps to support Parliament during the Civil War of 1642. By supporting the Great Reform Act of 1832 – a milestone in the English democratization process – Farm Grant boroughs also contributed to the modernization of Parliament, restricting the influence of elites via patronage.

The co-emergence of municipal self-governance and merchant representation in Parliament was not unique to England. We document close similarities in other countries and regions across Europe during the Commercial Revolution. However, the degree to which self-governed communities shaped nationwide institutions in subsequent centuries differed across the continent. An important factor was the centralization of power: In most of Continental Europe, monarchs had been unable to impose a strong central rule similar to that of Norman England. Military power remained concentrated in towns, albeit to various degrees. Strong military power of local elites led to the emergence of independent city states, as in Northern Italy. In France and Spain, local military elites were less powerful, but nevertheless important: They controlled autonomous towns’ governing bodies alongside merchants. When the pressure to generate fiscal revenues increased significantly during the 16th and 17th centuries, kings in France and Spain managed to circumvent parliaments by entering deals with the (mostly military and landed) local elites, whereby the latter ‘farmed’ taxes from which they were themselves largely exempt: in 17th century France, “society took the form of a late, recharged feudalism [...]” (Beik, 2005). English kings also attempted to increase their tax revenues by circumventing Parliament and gaining influence via patronage. We show that Farm Grant boroughs successfully resisted these attempts, contributing to the strengthening of the English Parliament. Our results can thus help to explain the institutional divergence between most of Continental Europe and England over the early modern period (Van Zanden et al., 2012).

FIGURES

Figure 1: Administration in Royal and Mesne Territories

Note: The figure illustrates the main administrative layers in royal and mesne territories for the case of boroughs without Farm Grants. See Section 3.4 for a description of ordinary taxation (tax farming) and extra-ordinary taxation (typically for warfare). For boroughs with Farm Grants, local officials were elected by the borough’s burgesses, and tax collection was self-administered by elected officials. This cuts out the role of the sheriff in royal territories.
Figure 2: Farm Grants before 1348, by Borough Ownership

Note: This figure shows that Farm Grants were granted almost exclusively to boroughs in royal territories, and to a much lesser degree to boroughs owned by mesne lords (who owned smaller land areas). Overall, 90 out of 554 boroughs that existed in 1348 received Farm Grants. Among the 145 royal boroughs, 74 received Farm Grants (51%); among the 409 boroughs owned by mesne lords, only 16 (3.9%).

Figure 3: Farm Grants before 1348, by Lord’s Territory Size

Note: The figure shows that boroughs owned by lords with larger territory were more likely to receive Farm Grants by 1348. The x-axis reflects the size of lord’s territory, from smallest to largest: 1=seigneur/abbot/nunnery (overall 229 boroughs); 2=bishop (72 boroughs); 3=earl/archbishop (108 boroughs); 4=king (145 boroughs). The y-axis plots the proportion of boroughs in a lord’s territory that received Farm Grants. Appendix B.3 describes the categorization of boroughs by the size of their lords’ territories.
Figure 4: All Boroughs in the Dataset, by Royal and Mesne

*Note:* This figure shows the location of the 554 boroughs in our dataset that existed by 1348. Solid squares indicate the 145 royal boroughs, and hollow dots, the 409 mesne boroughs (owned by local lords or by the Church). The figure also shows the location of navigable rivers and of Roman roads.

Figure 5: Taxable Wealth in 1086, by Borough Ownership

*Note:* This figure shows that taxable wealth was similarly distributed across royal boroughs (dashed line) and mesne boroughs (solid line). Taxable wealth was assessed by the Normans after their conquest of England in 1066, and summarized in the Domesday Book in 1086. There are 85 royal boroughs and 269 mesne boroughs with data on taxable wealth in 1086.
Figure 6: Enfranchisement in Parliament of Boroughs over Time

Note: The figure shows the enfranchisement in Parliament for boroughs with and without Farm Grants, before and after 1348. The left part of the figure contains data for all 554 boroughs that existed before 1348; out of these, 130 were enfranchised in 1348. By 1348, 90 boroughs had Farm Grants; among these, 64 boroughs (71.1%) were enfranchised. Among the 464 boroughs without Farm Grants, 66 (14.2%) were enfranchised. The right part of the figure contains data for 492 boroughs that existed by 1700 and had not been enfranchised by 1348 (altogether, 621 boroughs existed in 1700; 71 were newly formed after 1348, and four boroughs had ceased to exist; see Appendix B.3 for detail). Out of these 492 boroughs, 73 were enfranchised by 1700 – the majority (62) were boroughs without Farm Grants.

Figure 7: Enfranchisement: The role of Farm Grants and Restrictions on Entry by Royal Officials

Note: The figure shows that boroughs with Farm Grants were significantly more likely to be represented in the English Parliament by 1348. This relationship is particularly strong for boroughs that also had constraints on sheriffs entering the borough (and thus restricted means for central authorities to collect extra-ordinary taxes). Restrictions on entry comprise a borough’s liberties that prohibited royal officials from entering the borough in their judicial functions (non-intromittat), in financial functions (direct access to the Exchequer), or to enforce royal orders (return of writs).
Figure 8: Voluntary Troops to Support Parliament during the Civil War in 1642

Note: The figure shows that boroughs with Farm Grants were significantly more likely to raise volunteer troops to support Parliament at the beginning of the Civil War in the summer of 1642. Data on volunteer troops are from Parliamentary records, as described in Appendix B.9.
Table 1: Balancedness of Geography and Wealth in Royal vs. Mesne Boroughs

| Panel A: Trade-related geographic features of boroughs | | | |
|---|---|---|---|---|---|---|---|---|
| | Raw Data | Values after Entropy Balancing‡ |
| | Royal Boroughs (overall 145) | Mesne Boroughs (overall 409) | p-value for difference in share | Mean for Royal Boroughs | Mean for Mesne Boroughs | p-value for difference in share |
| #boroughs share | #boroughs share | | | | | |
| Navigable River | 45 31.0% | 53 13.0% | <0.001 | 31.0% | 30.7% | 0.95 |
| Sea Coast | 29 20.0% | 66 16.1% | 0.309 | 20.0% | 19.9% | 0.99 |
| Roman Road | 64 44.1% | 114 27.8% | 0.001 | 44.1% | 43.7% | 0.94 |

| Panel B: Taxable wealth of boroughs in 1086 (Domesday book data) | | | |
|---|---|---|---|---|---|---|---|---|
| | Raw Data | Values after Entropy Balancing‡ |
| | Royal Boroughs (overall 85) | Mesne Boroughs (overall 269) | p-value for difference | Mean for Royal Boroughs | Mean for Mesne Boroughs | p-value for difference |
| ln(taxable wealth in 1086) | 1.885 | 1.622 | 0.098 | 1.885 | 1.884 | 0.995 |

Note: The table examines the balancedness of trade-related geography and taxable wealth for royal boroughs vs. mesne boroughs. While royal boroughs were relatively more likely to be located on trade-favoring locations, the overall number of boroughs with trade-favoring features was larger in mesne territories. In addition, the table shows that Entropy weighting can create balanced samples also in relative terms.

‡ Entropy balancing creates balanced samples by reweighing the observations in mesne boroughs to match the mean and variance of covariates in royal boroughs. In Panel A, these covariates are all three geographic variables jointly; in Panel B, taxable wealth only. See Hainmueller and Xu (2013) for details.

Note: The table shows that boroughs with Farm Grants were significantly more likely to have seats in Parliament by 1348. All regressions are run at the borough level. Robust standard errors in parentheses. * p<0.1, ** p<0.05, *** p<0.01. Terrain controls include soil quality as well as ruggedness in a 10 km radius around each borough.
# Two-stage least square regression that uses location on a navigable river, the sea coast, and on a Roman road to predict Farm Grants by 1348 in the first stage. The first-stage F-statistic is 10.4.
§ Entropy balancing reweighs the observations in mesne boroughs to match the mean and variance of navigable river, sea coast, and Roman road in royal boroughs. See Hainmueller and Xu (2013) for details.
† Two-stage least square regression that uses the following variables to predict Farm Grants by 1348 in the first stage: location on the sea coast, on a navigable river, and on Roman roads, and the interaction of these three variables with status as royal borough, as well as the status as royal borough itself. The first-stage F-statistic is 6.7.
‡ Two-stage least square regression that uses only the three interaction terms and controls for the variables in levels. The first-stage F-statistic is 10.6.

Note: The table shows that our main results (from Table 4) are robust to excluding wealthy and large Medieval boroughs. Columns 1-4 exclude boroughs with taxable wealth above 50 (the 15 richest boroughs, 6 royal and 9 mesne – see Figure 5 for the distribution of wealth). Columns 5-8 exclude the top-10 percentile of boroughs in terms of taxable wealth or population in 1290 (where the 90th percentile is 10,000) – this excludes 40 boroughs, 15 royal and 25 mesne. All regressions are run at the borough level. Robust standard errors in parentheses. * p<0.1, ** p<0.05, *** p<0.01.

‡ Two-stage least square regressions that use the three interaction terms of Royal Borough with Navigable River, Sea Coast, and Roman Road to predict Farm Grants in the first stage. The first stage also controls for the three geography variables in levels; the p-value for their joint significance is reported. The first-stage F-statistic is 10.1 in col 2 and 8.8 in col 6 (both corresponding to a max. 10% relative bias).

# Propensity score matching with two nearest neighbors. In columns 3 and 7, using taxable wealth in 1086 (from the Domesday Book) as matching variable, and in cols 4 and 8, using borough population in 1290. Additional matching variable (Royal borough) indicated by “mv.”

</table>

Note: This table shows that after being incorporated (in the 15th-17th century), boroughs with Farm Grants saw significantly less influence of the king on the appointment of their local public officials. Influence of the king is a dummy variable that takes on value one if, at the time of incorporation of a borough, the following two conditions held: i) First appointment: the king appointed the first members of the newly formed corporation’s governing body (mayor, aldermen, and councilmen), and ii) Co-Optation: the initial council appointed subsequent council members – a process that maintained closed governing bodies. All regressions are run at the borough level. Robust standard errors in parentheses. * p<0.1, ** p<0.05, *** p<0.01. Terrain controls include soil quality as well as ruggedness in a 10 km radius around each borough.

† Two-stage least square regression that uses the following variables to predict Farm Grants by 1348 in the first stage: location on the sea coast, on a navigable river, and on Roman roads, and the interaction of these three variables with status as royal borough. Since the dependent variable reflects royal influence, the status as royal borough is included as a control. The first-stage F-statistic is 5.0 (corresponding to a max. 30% relative bias)

Note: The table provides suggestive evidence that Farm Grants affected institutional outcomes in the long run, even if trade was obstructed (after boroughs received Farm Grants) by exogenous events such as silting of rivers and harbors, or the construction of watermills up/downstream that hampered transport. The dependent variable in column 3 – the share of employment in trade-related professions – is from the 1831 census, and has been collected for enfranchised boroughs by A tidt and Franck (2015). Robust standard errors in parentheses. * p<0.1, ** p<0.05, *** p<0.01.
† First principle component of two indicators for commercial importance: “Freedom from tolls” (a grant of liberty that exempted a borough’s burgesses from tolls throughout the realm) and an indicator variable for whether a borough was a commercial hub during the 14th century, based on Masschaele (1997). The variable has mean zero and standard deviation 1.
‡ First principle component of the four proxies for open MP elections used in Table 8. The variable has mean zero and standard deviation 1.
